For complete data, refer to 1941 Mech. Equip. Index.

Ratio—4.11-1 Standard. 3.73-1 Optional.

NOTE—Axles may be identified by prefix on serial number (located on top of the differential carrier casting on the right side of the center rib) as follows: 4.11-1—'AG' or 'AJ'. 3.73-1—'AH' or 'AP' (optional gear ratio).

Backlash—.005-.007". Screw adjustment.

Removal:—Raise rear of car, remove rear wheels and brake drums, install clamps on wheel brake cylinders, disconnect hand brake cables from brake pull rods and remove cables from cable clamps on frame, disconnect brake line at axle housing and shock absorber 'I' bolts at spring seats. Remove spring 'U' bolts, disconnect spring shackles and drop springs. Pull axle assembly back to free front end of drive shaft. Withdraw axle assembly from beneath car.

Rear Spring Rear Shackle Note—2 types used in production. First type same as 1940. Second type rubber bushed and requires no lubrication. ***See Chevrolet Shop Notes for Rear Spring Rear Shackle servicing.***

Axle Shaft Removal:—Wheel bolted directly on flange on outer end of axle shaft. Shaft retained by 'C' washer on inner end of differential case. To remove axle shaft, remove wheel, take out two 'zipon' brake drum retaining nuts (on second wheel stud at either side of drain hole in drum), remove drum, install clamp on wheel brake cylinder. Remove axle housing cover, differential pinion shaft lock screw, pinion shaft and axle shaft spacer. Push axle shaft in, remove 'C' washer on inner end of shaft, pull shaft out.

Installation—Assemble new oil deflector, gasket (coat both sides with heavy shellac or paint), line up extra hole (center hole of closely grouped three holes) with notch in hub flange on axle shaft (oil pocket in oil deflector should also be aligned with this notch), install six special bolts, forcing heads down to deflector, and peen shoulder on bolts into countersink around bolt holes in flange using Special Peening Tool and Anvil so that these parts are riveted together. Check endplay adjustment (below). NOTE—Axle shafts unequal length. Use longer shaft on right hand side.

Endplay Adjustment—When installing shaft, select correct spacer block (see below) so that with spacer installed on pinion shaft between inner ends of axle shafts, shaft endplay will be from a Free fit to .014" maximum clearance.

Axle Spacer (Passenger Car)—Three spacer blocks furnished which give four sizes as follows: Narrow—1.0105". Medium—1.0195" and 1.0295". Wide—1.0345".

(Trucks)—Two spacer blocks furnished which give three sizes as follows: Narrow—1.1485". Wide—1.1575" and 1.1675". **These dimensions are taken across ground surfaces.**

NOTE—Spacers should be installed with ground surface toward axle shaft end. Medium (Passenger Car), Wide (Truck) Spacers are ground on all four sides (giving two different sizes as listed above).

SHOCK ABSORBERS:—Delco Model 2200-A,B (front), 2100-A,B (rear). Double acting, hydraulic, parallel cylinder type. Same as 1940 types except for valve changes due to increased car weight.

Shock Absorber Valve Change to correct 'Crunching' Noise in Front Shock Absorber—New valve (part #1069124) released during production. Valve marking same as first type. ***For complete data, refer to 1941 Mechanical Equipment Index for 'Delco Parallel Cylinder Type' Shock Absorber article.***

STEERING:—Steering Gear—Saginaw Worm-and-Roller type.

For complete data, refer to 1941 Mech. Equip. Index.

Front Suspension:—Independent, linked parallelogram type with coil springs. Same as 1940 except for longer springs, larger wheel spindles and new front wheel inner bearings.

'Crunching' Noise Correction—See Shock Absorber Valve Change Note above.

For complete data, refer to 1941 Mech. Equip. Index.

NOTE—Make checks with car weight on wheels and special gauge installed at front to level frame.

Kingpin Inclination—4¾° ± ½°.

Caster—0° ± ½°. Adjustable.

Camber—Negative ¼° ± ½°. Adjustable.

Toe In—0-1/16". To adjust, loosen clamp bolts at each end of **left tie rod** and turn rod. When tightening clamp bolts, tie rod ends must be in alignment with ball studs (to prevent binding).

Steering Geometry (toe-out on turns)—Outer wheel turned 20°. Inner wheel turned 24° ± 2°.

BRAKES:—Service—Own Make. Hydraulic type. Hand lever applies rear wheel service brakes.

For complete data, refer to 1941 Mech. Equip. Index.

Wheel Cylinders—Diameter: 1¼" (front), 1 3/16" (rear). Sizes stamped under adjusting cup lock spring on wheel cylinder housing.

Drums—Cast iron rim, steel web. Diameter 11".

Lining—Moulded type. Width 1¾". Thickness 3/16". Length per wheel 22⅝".

Clearance—Adjusting Cover (on wheel cylinder) backed off 4 Notches from slight drag position.

Braking Power—47½% rear wheels, 52½% front.

Hand Brake:—See Service brakes above.

MODEL DESIGNATION:—Models, Nominal Rating, and Wheelbases for all trucks are as follows:

Model	Nominal Rating	Wheelbase
AK	½ Ton	115"
AJ (Dubl-Duti)	½ Ton	115"
AL	¾ Ton	125¼"
AN	¾ Ton Long W. B.	134½"
YR	1 & 1½ Ton	134½"
YS	1½ Ton	160"
YU (Cab-Over-Eng.)	1½ Ton	109⅛"
YV (" " ")	1½ Ton	132⅝"
YW (" " ")	1½ Ton	158⅛"
YT	School Bus	160" & 195⅛"

SERIAL NUMBER:—First number 1001 (all models) with model prefix as listed above. On plate on rear side of dash (Cab-Over-Engine), on right side of cowl under engine hood (all others).

ENGINE NUMBER:—Stamped on right side of crankcase to rear of distributor. First No. 1001 (each plant) with prefix letters as follows:

Model	Flint	Buffalo (Tonawanda)
½ Ton	AD	AE
¾ & ¾ Ton Special	AAF	AAN
1½ Ton	AF	AN
1½ Ton (235 cu. in. Engine)	AG	—
1½ Ton C-O-E	AJ	—
1½ Ton C-O-E (235 cu.in. Eng.)	AL	—
Dubl-Duti Panel	AM	—

FLEET MODEL NOTE:—Same as passenger car. *See 1941 Chevrolet Passenger Car 'M' page (preceding).*

ENGINE SPECIFICATIONS (REGULAR ENGINE) AND SERVICE DATA:—*See 1941 Chevrolet AG and AH 'M' pages (preceding) for complete data.* All data (Pistons, Rings, Pins, Connecting Rods, Main Bearings, Camshaft, Valves, Lubrication and Cooling System) same as for passenger cars except as noted.

SPECIAL 235 CUBIC INCH OPTIONAL TRUCK ENGINE:—Available as a regular production option on all 1½ Ton Heavy Duty & C-O-E Trucks.

Servicing:—All service operations and clearances same as for Regular Engine except for connecting rod oiling system adjustment. *See 1941 Chevrolet AG and AH 'M' pages (preceding) for complete data.*

Non-interchangeable Parts:—Parts are interchangeable between the Regular Engine and the Special 235 Cubic Inch Engine except as follows: Cylinder Block and Crankcase, Cylinder Block Assembly (Short Motor), Push Rods (approximately ¾" longer on large engine and identified by shoulder just below cup at top end), Valve Tappets, Camshaft, Piston and Pin Assembly, Piston Rings (Compression and Oil Control), Crankshaft, Connecting Rod, Harmonic Balancer, Oil Pan, Oil Pan Pipe Assembly, Oil Distributor to Valve Rocker Shaft Pipe Assembly, Oil Pump Screen Cover Support Assembly.

ENGINE SPECIFICATIONS (235 CUBIC INCH OPTIONAL TRUCK ENGINE):—6 cylinder, valve-in-head **Bore**—3 9/16". **Stroke**—3 15/16". **Displacement**—235.5 cu. ins. **Rated HP**—30.4. **Developed Horsepower**—93 HP at 3100 RPM. **Compression Ratio**—6.62-1 std. cast-iron head. *See Special 235 Cubic Inch Optional Truck Engine Note above for Servicing and Non-interchangeable Parts.*

CLUTCH (AL, AN, YR, YS, YU, YV, YW, YT):—**Own Make.** Diaphragm spring, single plate, dry disc type. NOTE—Driven member vibration dampener now equipped with 6 (coil) springs instead of 8. *For complete data, refer to 1941 Mech. Equip. Index.*

½ Ton & Dubl-Duti Note—Passenger car clutch used. *See 1941 Chevrolet Passenger Car 'M' page (preceding).*

Facings—Woven asbestos, 2 used. Inside Diam. 7". Outside Diam. 10¾". Thickness .137-.143".

Adjustment & Removal:—Same as passenger car. *See 1941 Chevrolet Passenger Car 'M' page (preceding).*

3 SPEED TRANSMISSION (AK, AJ, AL):—**Own Make.** All helical gear type. Constant-mesh, synchro-mesh (second and high), sliding gear (low and reverse). *For complete data, refer to 1941 Mech. Equip. Index.*

Removal:—See 4 Spd. Transmission Removal (below).

4 SPEED TRANSMISSION (OPTL. AK, AJ, AL; STD. ON ALL OTHERS):—**Own Make.** Sliding spur gear type. *For complete data, refer to 1941 Mech. Equip. Index.*

Important Gear Change Note—Two different low and reverse gear ratios used during 1941. Ratios may be identified by transmission serial numbers and identification markings. *For complete data, see 1941 Mechanical Equipment Index for Chevrolet 4 Speed Truck Type Transmission article.*

Transmission Control (Cab-Over-Engine):—Remote control type. *See Chevrolet Shop Notes for data.*

Removal (AK, AJ):—Remove floor boards. Disconnect speedometer cable. Remove hand brake lever from transmission. Remove 4 universal joint ball collar-to-retainer capscrews and slide ball back on propeller shaft housing. Remove 4 capscrews which secure trunnion bearings to front yoke. Remove 2 front yoke trunnion bearings and split the joint. Push front end of propeller shaft down for clearance (NOTE—On 4 spd. transmission, frame cross member must be removed to drop shaft). Remove 2 upper transmission-to-clutch housing capscrews and insert guide pins, remove clutch underpan and take out 2 lower mounting capscrews and slide transmission out and remove. NOTE—On 4 spd. type transmission 2 brake master cylinder bracket capscrews must be removed.

Removal (AL):—Remove floor boards. Disconnect speedometer cable. Remove hand brake lever from transmission. Split center universal joint by removing two trunnion bearing 'U' clamps (tape or wire trunnions together to prevent losing bearings). Remove 4 universal ball retainer-to-transmission bolts and slide retainer back on tube. Remove center bearing support bracket-to-frame cross member bolt nuts. Pull front propeller shaft assembly to rear free of front universal. Remove transmission as for AK and AJ using guide pins.

Removal (YU):—Removal same as for AL (above) except that one propeller shaft only used. Split front universal and remove transmission (as above).

Removal (All Others):—Remove floor boards. Disconnect speedometer cable. Remove hand brake lever from transmission. Split front universal joint by removing two trunnion bearing 'U' clamps (tape or wire trunnions together to prevent losing bearings). Remove center bearing support bracket-to-frame cross member bolts. Pull front propeller shaft assembly to front to free from rear shaft. Then remove transmission as for AK, AJ above.

UNIVERSAL JOINTS:—**Own Make.** Needle bearing type (AJ, AK), bushing type (AL—front universal only). **Spicer**—Needle bearing types (all others). *For complete data, refer to 1941 Mech. Equip. Index.*

Propeller Shaft Support Bearing:—*See Chevrolet Shop Notes for servicing instructions.*

REAR AXLE (AK, AJ, AL, AN):—**Own Make.** Semi-floating, Hypoid gear type with Torque Tube drive (AK, AJ), Hotchkiss drive (AL, AN). *For complete data, refer to 1941 Mech. Equip. Index.*

Ratio—4.11-1 (AK), 4.55-1 (all others).

Backlash—.005-.008" (all). Screw adjustment.

Removal, Axle Shaft Removal, Endplay Adjustment:—Same as for Passenger Car (except on AL and AN propeller shaft can be disconnected at rear universal for Rear Axle Removal). *See 1941 Chevrolet Passenger Car 'M' page (preceding) for data.*

REAR AXLE (YR, S, T, U, V, W):—**Own Make.** Full-floating, Hypoid gear type with Hotchkiss drive. *For complete data, refer to 1941 Mech. Equip. Index.*

Ratio—6.17-1 Std., 5.43-1 Optl. NOTE—Axles identified by prefix letters on part number stamped on top right side of differential housing as follows: 6.17-1—'AR' or 'AS'. 5.43-1—'AT' or 'AW'.

Backlash—.005-.008". Screw adjustment.

Removal:—Remove differential cover and axle shafts (see below). Disconnect rear universal by removing two U-bolts from rear yoke (wire trunnions to retain bearings). Slide shaft forward and lower to floor. Remove differential carrier mounting bolts.

Axle Shaft Removal:—Bend lock plate lugs away from capscrew heads, take out 8 capscrews in axle shaft flange, install two 7/16" x 14 capscrews in tapped holes in flange (between regular screw holes), turn screws up evenly to loosen shaft, withdraw shaft and aluminum gasket. NOTE—Use new aluminum gasket and lock plate when shaft installed.

Wheel Bearing Adjustment:—Remove axle shaft (see above), locknut and adjusting nut lock (within wheel hub), use J-870 wrench and tighten adjusting nut tight, then back off 45°, see that wheel hub turns freely by hand, install lock and locknut, bending lock tangs in notches on both nuts.

REAR AXLE (TWO SPEED):—Optl. on all Trucks. *For complete data, refer to 1941 Mech. Equip. Index.*

Ratio—5.64-1 & 8.22-1 Std. 6.17-1 & 8.22-1 Optl.

Backlash—.006-.012". Screw adjustment.

Removal, Axle Shaft Removal & Wheel Bearing Adjustment:—Same as regular truck axle (above).

SHOCK ABSORBERS:—**Delco Hydraulic Type.** Single acting front and rear (AJ, K, L, N). Double acting type Optl. *For data, refer to Mech. Equip. Index.*

STEERING:—**Steering Gear**—Saginaw Ball-Bearing Worm-and-Nut. *For data, refer to Mech. Equip. Index.*

Front Suspension:—Conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs. NOTE—Kingpin bushings 'floating' type on AJ, K, L, N.

Kingpin Inclination—7°10' (all except Cab-Over-Engine), 8° (Cab-Over-Engine), ± 1° crosswise.

Caster—1¾° (AJ, AK, AL, AN), 2¾° (YR, YS, YT), 3° (YU, YV, YW), ±½°. Adjust by inserting wedge shims between spring and axle (up to 2°), use tools for greater correction.

Camber—1° ±½°. Bend cold for minor corrections.

Toe In—5/64"-⅛". Adjust by turning tie rod.

Steering Geometry—Outer wheel 20°, Inner 23° ±2°.

BRAKES:—**Service—Own Make.** Hydraulic type. Hand lever applies rear service brakes. *For complete data, refer to 1941 Mech. Equip. Index.*

Wheel Cylinders—Diameter 1¼" (front wheels—all), 1 3/16" (rear—AJ, AK, AL), 1⅜" (rear—¾ Ton Special, AN), 1½" (rear—all others). Size stamped on housing under adjusting cup lock spring.

Drums—Cast alloy iron (except YU, YV, YW), pressed steel (YU, YV, YW). Diameters 11" (all AJ, AK, AL, front AN), 14" (rear AN, front YR, S, T, U, V, W), 16" (rear YR, S, T, U, V, W).

Lining—Moulded type	Width	Thickness	Length
AJ, AK, AL; AN (front)	1¾"	3/16"	22⅝"
AN (rear)	2"	17/64"	38½"
YR, YS, YT (front)	2"	¼"	28⅞"
YR, YS, YT (rear)	3"	¼"	35 13/16"
YU, YV, YW (front)	2"	17/64"	28⅞"
YU, YV, YW (rear)	3"	17/64"	35 13/16"

Clearance—Adjusting cover backed off 4 Notches (AJ, AK, AL), 5 Notches (all others—front wheels), adjusting pinion shaft backed off ¾ turn (YR, YS, YT, U, V, W—rear), from slight drag position.

Hand Brake:—See Service Brakes above.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

HOOD LOCK:—Chrysler C28, C30, C33; Dodge D19. Conventional center hinge hood. Each side locked by button under each end of instrument panel. To raise hood side, pull button out on side to be raised which unlatches hood, lift up on edge of hood. NOTE—Dodge hood side panels are removable.

Control Cable Adjustment—Cable for each hood side must be adjusted separately as follows: Pull out on control button on instrument panel on side to be adjusted, press down on hood to lock it in place. Open opposite side for access to control cable on locked side. Loosen screw on clamp at forward end of cable on front fender panel (for Chrysler), on hood side panel (for Dodge), and adjust clamp for less than ⅛" free play in cable (excessive free play allows wire stop to contact cable sheathing before latch is released), tighten screw. Repeat operation for opposite hood side.

De Soto S8, Plymouth P11, P12:—Alligator type hood with control button under left side of instrument panel. A safety catch is located under nose of hood. To raise hood, pull out on control button (hood will raise slightly), push up on saftey catch under front end of hood, lift hood up. NOTE—Plymouth hood side panels can be removed.

Control Cable Adjustment—Raise hood, loosen set screw in clamp on front end of cable, adjust clamp position for ⅛" minimum free play between clamp and latch arm in locked position, tighten set screw. Check safety catch for proper locking action.

HOOD ALIGNMENT:—Chrysler C28, C30, C33; Dodge D19. Hood fit to side panels adjustable by loosening screws at front and rear pivot plates, adjust hood for proper clearance at side panels, tighten pivot plate screws. No adjustment required at spring latches. Check Hood Lock for proper locking action (see Control Cable Adjustment above).

De Soto S8, Plymouth P11, P12:—Hood alignment may be adjusted as follows: (1) Hood lock latch stud at front end. To adjust, loosen locknut on top of stud, turn stud in or out for proper hood fit, tighten lock nut. (2) Hood hinge position. Open hood just beyond normal open position, unhook hood hinge spring and remove spring. Loosen lower hood hinge bracket screw (on inner side on cowl extension) and upper screw (on outer side at upper rear corner of hinge). Do not disturb front upper cap screw (this must be tight to hold hinge in position). Align hood hinge by closing hood. Open hood carefully without disturbing hood hinge position and tighten screws. (3) Hood fore-and-aft position. Open hood, loosen three hood-to-hinge screws (on under side of hood ledge at rear), shift hood position backward or forward until correct fit obtained, tighten screws. Check Hood Lock for proper locking action (see Control Cable Adjustment instructions above).

FRONT END ASSEMBLY (UNIT) REMOVAL:—Radiator shell, radiator core, and both front fenders (including hood side panels on Dodge and Plymouth) can be removed as an assembly as follows: Raise hood and drain radiator. Remove hood on Chrysler and Dodge only. Disconnect battery cables at battery. Remove battery on Plymouth only. Disconnect horn wires at relay and remove horn and mounting plate assembly on Plymouth only. Disconnect headlight wires at junction block on left fender. Disconnect hood latch release cables (at each side on Chrysler and Dodge, at lock plate on radiator shell on De Soto and Plymouth). Remove hood lock and plate assembly on Plymouth only (mark plate and radiator shell and reassemble to these marks when installing assembly). Remove front bumper assembly on all models except De Soto. Remove engine inlet and outlet water hoses. Remove fender-to-body stud nuts and studs, and nuts from fender braces and running boards. With a man at each side lifting on fender skirt, radiator shell, radiator core, hood lower side panels and both front fenders can be removed as an assembly. When installing assembly, attaching bolts should be installed loosely, hood aligned (see Hood Alignment above), and then tighten to secure assembly on car.

RADIATOR CORE REMOVAL:—6 cylinder Cars—Remove hood and radiator ornament (on Chrysler and Dodge only). Drain cooling system. Remove inlet and outlet hoses. On Chrysler, remove water outlet elbow and thermostat, fan belt, water pump cap screws, and lift water pump out. On Dodge, remove fan blade cap screws in flange on pump shaft and take off fan blades. Free headlight wires from clips so that wires clear radiator. Remove nuts and cap screws from radiator support on each side. On De Soto and Plymouth, remove brackets at upper left and right corners of radiator support. Lift radiator core up and out of chassis (on Chrysler and De Soto, tilt upper end of core back).

8 cylinder Cars—Remove hood and radiator ornament, drain cooling system. Remove front end assembly (see Front End Assembly (Unit) Removal above). Remove radiator support-to-core cap screws and nuts. Lift radiator core out.

OIL PAN REMOVAL:—Drain oil and replace drain plug. Remove clutch housing underpan to avoid damaging oil pan gaskets on underpan dust shield (NOTE—On Eight cylinder cars, raise rear of engine slightly so that pan clears frame cross-member). Remove oil level indicator, drop oil pan on tie rod. Pan can then be removed by reaching in under crankcase and raising oil strainer to clear baffle while sliding pan out to rear.

Installation (6 cylinder Engines)—When installing new gaskets, end gaskets should extend ¼" to ⅛" above level of oil pan (these ends must not be cut off). Side gasket installed with ends resting on top of protruding end gaskets. Gaskets will be compressed into place when pan screws tightened.

ENGINE ASSEMBLY REMOVAL:—Engine, clutch, and transmission assembly can be removed from car as an assembly as follows: Remove the hood. Remove Front End Assembly (see removal instructions above). Remove propeller shaft (on cars with two shafts see Propeller Shaft Center Bearing Removal following). On cars with Power Shift remove the vacuum control unit. Disconnect the following: Fuel pump flexible line at pump, exhaust pipe at manifold, throttle controls, choke control (on Plymouth only), heat indicator tube and bulb at head, oil gauge line at flexible tube, generator wires, speedometer cable, hand brake, gear shift and selector rods at transmission, clutch pedal linkage and torque tube, windshield wiper vacuum hose (on cars with vacuum type wiper). Remove crankcase ventilator breather pipe and front and rear engine support bolts. Connect hoist to engine (remove air cleaner if necessary) and lift assembly out of chassis. When re-installing assembly reverse procedure listed above, check Hood Alignment and Hood Lock operation (see instructions above).

ENGINE NUMBER LETTERING ('SPECIAL STANDARD BORE & BEARING SIZES):—Letters used with engine number **(not in circular pads)** denote following 'special standard' sizes: **'A'**—.020" larger standard cylinder bore. **'B'**—.010" smaller standard main and connecting rod bearings. **'AB'**—Cylinder bore, main and connecting bearings 'special standard'.

ORIGINAL PISTON & CYLINDER BORE SIZES:—Original production (new engine) piston and bore sizes indicated by letter located as follows:

Piston Size—Letter stamped on piston head (number following letter on Dodge pistons is weight).

Bore Size—Letter stamped on pad at top of block on distributor side.

.020" Oversize Pistons and Bores—Graded in same steps as for standard sizes except .020" larger and marked P, Q, R, S, and T.

CHRYSLER C28, DE SOTO S8

Piston & Engine Mark	Piston Diameter	Cylinder Diameter
A	3.37425-3.37475"	3.37475-3.37525"
B	3.37475-3.37525"	3.37525-3.37575"
C	3.37525-3.37575"	3.37575-3.37625"

PLYMOUTH P11, P12①

A	3.12415-3.12465"	3.12475-3.12525"
B	3.12465-3.12515"	3.12525-3.12575"
C	3.12515-3.12565"	3.12575-3.12625"
D	3.12565-3.12615"	3.12625-3.12675"
E	3.12615-3.12665"	3.12675-3.12725"

①—Data for aluminum alloy, U-slot pistons only. Steel-banded type pistons also used on these cars.

Additional Piston Sizes—AA pistons .0005" smaller than A pistons, EE pistons .005" larger than E

Dodge Steel Strut Piston Weight—All 6 pistons in one block must be alike (same number on head).

REPLACEMENT PISTONS:—Finished Pistons—Furnished in standard size and .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize. **Semi-finished Pistons**—Furnished in two sizes: (1) for cylinder bores from standard to .023" oversize, (2) for bores .025-.050" oversize. Pistons are finished except for skirt (head and ring grooves finished). **Piston skirt must be cam ground** and not finished circular. IMPORTANT—Second group pistons (.025-.050") must not be used for oversizes below .025" due to piston head and ring grooves being finished to different size than first group.

CONNECTING ROD BEARINGS:—Removal & Installation. Bearing shells can be removed after taking off bearing caps. When installing bearing shells, oil hole in rod and bearing must be aligned and ear on bearing halves fitted in notch in rod and cap.

Fitting Bearings—To check bearing clearance, place an oiled piece of feeler stock, .0015" thick (Sixes), .002" thick (Eight), ½" wide and 1" long between bearing and crankshaft. Tighten bearing cap bolt nuts. Bearings clearance is correct when slight drag felt when turning crankshaft by hand. If no drag felt, and crankshaft journal out-of-round and taper not over .001", install proper undersize bearing listed below.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Undersize Bearings—Finished bearing shells furnished .001", .002", .010", .012" undersize. Install .001" or .002" undersize bearings on standard crankshafts which show slight wear, .010" for 'Special Standard' .010" crankshafts (see Engine Lettering 'Special Standard' Bore & Bearing Sizes Note above), .012" bearings for 'Special Standard' .010" crankshafts which show slight wear. Bearing size correct when proper clearance obtained (see Fitting above).

MAIN BEARINGS:—Removal & Installation (with engine in car). Bearing shells can be removed and installed without removing crankshaft as follows: Remove oil pan (see Oil Pan Removal following), clutch housing underpan, oil pump strainer, and crankshaft pulley shield. On six cylinder engines, remove oil pan front end oil seal plate by taking out 2 lower screws on chain case cover. On eight cylinder engines, remove two lower screws on timing chain cover to front main bearing cap, and front and rear main bearing caps using Special Puller Tool C-305 (caps are sealed in position and puller must be used to remove them). Remove one bearing cap at a time and with Special Tool C-584 inserted in oil hole in crankshaft, upper bearing shell can be rotated out by turning crankshaft in clockwise direction. Upper bearing shells can be installed by reversing removal procedure. Sharp edge on plain edge of bearing should be removed by chamfering it slightly. CAUTION—Upper and lower bearing shells on Chrysler Six and De Soto on all except rear are alike and interchangeable, rear bearing halves interchangeable and must be used only at #4 bearing. Upper and lower bearing shells on Chrysler 8, Dodge, and Plymouth are not interchangeable. Bearing half with oil hole must be used for upper half of bearing.

Fitting Bearings—To check bearing clearance, place an oiled piece of feeler stock, .002" thick, ½" wide, and 1" long between bearing and crankshaft. Tighten bearing cap nuts or cap screws. Bearing clearance is correct when slight drag felt when turning crankshaft by hand. If no drag felt, and crankshaft journal out-of-round and taper not over .001", install proper undersize bearing listed below.

Undersize Bearings—Finished bearing shells furnished .002", .010", .012" undersize. Install .002" undersize bearings on standard crankshafts which show slight wear, .010" for 'Special Standard' .010" crankshafts (see Engine Lettering 'Special Standard' Bore & Bearing Sizes Note above), .012" bearings for 'Special Standard' .010" crankshafts which show slight wear. Bearing size correct when proper clearance obtained (see Fitting Bearings above).

Replacement Main Bearing Caps—Furnished for service where original caps damaged of broken (the original caps should not be filed or shimmed—See Fitting Bearings above). Replacement main bearing caps 1/16" shorter and have 1/64" larger stud holes than original caps to permit fitting on engine. These caps must be fitted on engine since they are line-reamed on master fixture and not on engine which results in size variation. Fit replacement caps on engine by filing or shimming to obtain proper bearing clearance only when first installed on engine. When servicing bearings on engines with replacement caps already installed, fit bearings as directed above without filing or adding shims.

CRANKSHAFT OIL SEALS:—Servicing—Car manufacturer recommends that new oil seals be installed if chain cover or rear bearing cap removed.

Front Oil Seal—Oil seal located in timing chain cover. Consists of spring-backed composition seal in a stamped steel housing pressed in chain case cover with composition gasket installed between seal and cover. To install seal proceed as follows: Insert new composition gasket in chain case cover, drive new seal in place with drift or similar tool slightly larger than seal (seal is press fit in cover), seal must have a tight, even fit in seat in cover. Center seal on crankshaft when installing chain case cover as follows: Install chain case cover on engine with cover screws tightened just enough to hold cover in place, install Special Centering Tool C-522 on end of crankshaft and hold it in place by tightening crankshaft starting jaw finger tight, tighten chain case cover screws and as cover gasket is being compressed, tighten crankshaft starting jaw nut so as to maintain slight tension between centering tool and seal. Remove tool after chain case cover screws secured. Tighten starter jaw to 108 ft. lbs. min.

Rear Oil Seal (6 cylinder Engines)—Located at rear main bearing. Consists of oil seal packing assembled on rear face of bearing cap and crankcase (upper half held by retainer assembled on rear face of crankcase, lower half by retainer assembled on rear face of bearing cap). Gaskets used on top face of bearing cap at each side, around oil slinger grooves and along shoulder across cap. Install new packing in retainer on crankcase and cap, place new gaskets on cap and install on engine without disturbing position of gaskets.

Rear Oil Seal (8 cylinder Engines)—Located at rear main bearing. Consists of seal assembled on rear face of bearing cap and crankcase (upper half held by retainer assembled on rear face of crankcase, lower half by retainer asembled on rear face of bearing cap), and by rubber seals assembled in vertical grooves on each side of bearing cap. When installing rubber seals, upset grooves on each side of cap with prick punch to anchor seals in grooves and prevents seals sliding out when cap installed.

CAMSHAFT REMOVAL:—Remove Front End Assembly as a unit (see removal directions in first column). Remove cylinder head, fuel pump, oil pump, valve tappet cover plates, crankshaft pulley, front motor support (with front of engine jacked up), timing chain cover, camshaft sprocket and timing chain. If valves and valve springs are not to be removed, prop valves up by inserting wooden wedges at opposite sides under valve head. Raise tappets and hold in this position (use spring type clothes pins or similar tool to hold tappets up). Withdraw camshaft (rotate shaft to clear any obstructions).

Chrysler 8 Note—In addition to instructions listed above, two oil feeder lines in valve chamber must be removed and #4 piston must be on top dead center in order to remove camshaft.

EXHAUST VALVE SEAT INSERTS:—Inserts can be serviced by re-grinding only (cannot be re-cut due to hardness of material used). .010" oversize valve seat inserts should be installed where seats have been loosened in service. Inserts not used on inlet valves and seats can be serviced with re-cutting tools. Special Tool Set C-327, C-386 available for servicing exhaust valve seat inserts.

Re-Grinding—Clean valve guide, chamfer upper end of valve guide, fit valve guide pilot securely in place, dress grinding stones of Special Reconditioning Tool C-372 for concentricity on diamond dressing tool, operate grinding tool dry (CAUTION—Do not use valve grinding compound on inserts. Seat runout .0005" max. (check with dial indicator).

Replacing Inserts—Remove valves. Using Special Tool C-387, remove valve seat insert. Clean up insert seat in block by removing all burrs and rough edges (NOTE—If .010" oversize inserts to be installed, cylinder block must be cut to fit oversize valve seat insert). Install new valve seat insert (chill insert by using ice which contracts insert enough to permit easy installation in block), lock insert in block by using crimping or peening tool (in Tool Set C-387), re-grind insert (see above).

OIL PUMP REMOVAL:—Turn engine over until distributor rotor in firing position for #1 cylinder (allow engine to remain in this position while pump off engine) and remove capscrew in pump body.

Installation:—When installing oil pump where crankshaft has been moved while pump off engine, turn crankshaft until #1 cylinder is at firing position (both valves closed, piston on compression), set distributor rotor at #1 terminal and install pump. Then reset ignition timing (see 'T&E' page).

WATER DISTRIBUTION TUBE:—Removable one-piece tube installed in engine between cylinders and valve ports (on six cylinder engines), on right side of engine just above valve spring chamber (on eight cylinder engines) and distributes water from pump to exhaust valve ports through holes in tubes.

Servicing—A new tube should be installed whenever engine overhauled or when rusted or corroded in order to provide correct water circulation in engine block. To replace tube proceed as follows: Remove front end assembly (see Front End Assembly (Unit) Removal above). On six cylinder engines remove water pump which will expose front end of tube. On eight cylinder engines, remove welch plug to right of water pump to expose front end of tube. Remove tube by using rod with hook formed on end and engage it in slot on upper edge of tube just inside block, pull tube out. NOTE—On 8 cylinder engines, see that front end of tube flared in same manner as tube which was removed from engine.

PROPELLER SHAFT CENTER BEARING:—Used on all passenger car models with two propeller shafts. Consists of ball-bearing mounted on rear end of front propeller shaft with an oil seal assembled to front and to rear of bearing, and this assembly (bearing and oil seals) enclosed in a housing which is flange mounted on rear side of frame cross-member. An insulator is assembled on front end of housing. To remove assembly, remove nuts and lockwashers from differential and transmission companion flanges to free propeller shafts at front and rear, take out 4 center bearing housing-to-frame cross-member mounting bolts, remove propeller shaft and center bearing as an assembly.

HAND BRAKE ADJUSTMENT:—The hand brake adjustments can be made from beneath car as follows: Fully release hand lever (cable length adjusted by means of clevis at lower end). Adjust anchor screw for .015-.020" band to drum clearance by bending back tab of anchor screw lock and turning screw (on lower right side of brake), then lock screw by bending tab against flat of screw. Loosen guide bolt locknut and adjust guide bolt adjusting nut for .015-.020" band to drum clearance (these two nuts located in front of release springs at left side), then tighten locknut. Turn large adjusting bolt nut (on lower end of bolt below springs) for .015-.020" band to drum clearance for upper half of band. Groove in upper end of this nut must contact ridge on band operating lever spacer above nut. NOTE—Clearance between side of anchor bracket at center of band and anchor must not exceed .005" (if clearance excessive band may be distorted when brake applied). To correct, compress saddle in vise or place on block and tap lightly with a hammer.

HOOD LOCK, FRONT END ASSEMBLY & OIL PAN REMOVAL:—*See Chrysler Shop Notes.*

SERIAL NUMBER:—On right front door hinge post. First number: Detroit—7,657,501 (Royal), 7,901,601 (Windsor). Canada—9,717,741 (Royal).

ENGINE NUMBER:—First number C28-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Shop Notes for engine number lettering data ('Special Standard' bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3⅜". **Stroke**—4½". **Displacement**—241.5 cu. ins. **Rated HP**—27.34. **Developed Horsepower**—112 (Std. 6.8-1 or 6.5-1 hd.), 115 (Optl. 7.2-1 hd.—Std. 7 pass.), at 3600 RPM. **Compression Ratio and Pressure**—As follows:

Ratio	Pressure at 1000 RPM	At 125 RPM
6.8 or 6.5-1 iron	140-150 lbs.	115-125 lbs.
7.2-1 aluminum hd.	150-160 lbs.	120-130 lbs.

Vacuum Reading—Steady 18-20" idling (below 1000'). *See Chrysler Shop Notes for engine removal directions.*

PISTONS:—Aluminum alloy, U-slot, cam ground, tin coated. **Length**—3⅞". **Weight**—17.5 ozs. (stripped). **Removal**—Pistons and rods removed from above. **Clearance**—Top .023". Skirt .0000-.0010". **Original Bore & Piston Sizes, Replacement Pistons:**—*See Chrysler Shop Notes for sizes and markings.* **Fitting New Pistons:**—Check piston size with micrometer across large diameter at bottom of skirt. Insert .002" x ½" feeler between cylinder wall and piston (inverted, pin removed) on side opposite slot. Feeler pull 5-7 lbs. (with piston and block at 70° F). **Installing Pistons:**—Slot away from camshaft.

PISTON RINGS:—4 rings, all above pin #1 Compression (upper inner edge stepped), #2 Comp. (lower outer edge stepped), #3 & 4 (slotted oil rings).

Ring	Width	End Gap	Side Clearance
Comp. (Top)	⅛"	.007-.015"	.002-.004"
Comp. (#2)	⅛"	.007-.015"	.0015-.0035"
Oil Control	5/32"	.007-.015"	.001-.0025"

Replacement Rings:—Std. & .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2⅞". Floating type. Pin hole in rod bronze bushed. **Pin Fit in Piston**—Thumb push fit (piston at 130°). **Pin Fit in Rod Bushing**—Thumb push fit at 70°F. **Replacement Pins:**—Std. & .003", .005", .008" oversize.

CONNECTING ROD:—**Weight**—33.9 ozs. (with bearings and bolts). **Length**—7⅞". **Lower Bearing Diameter**—2⅛". *See Engine Lettering Note in Chrysler Shop Notes for 'Special Standard' size.* **Lower Bearing**—Removable, precision type, thin babbit on steel. **Clearance**—.0005-.0015". **Sideplay**—.0055-.0115". **Bearing Adjustment:**—None (no shims). Replace bearings. *See Chrysler Shop Notes for instructions.* **Replacement Bearings:**—*See Chrysler Shop Notes.* **Installing Rods:**—Oil metering hole toward camshaft.

CRANKSHAFT:—4 bearings, 9 integral counterweights. *See Chrysler Shop Notes for Replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.* **Bearing Diameters**—2½". *See Engine Lettering Note in Chrysler Shop Notes for 'Special Standard' size.* **Bearing Type**—Removable, precision type, thin babbitt on steel. **Clearance**—.001-.002". **Bearing Adjustment:**—*See Chrysler Shop Notes for bearing removal, replacement sizes and adjustment data.* **End Thrust:**—Taken by flange faces on rear (#4) main bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive. *See Chrysler Shop Notes for Camshaft Removal.* **Bearing Diameters**—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼". **Bearing Type**—Removable steel-backed, babbitt-lined bushings (except #4 machined in block). **Clearance**—.001-.003" (#1), .0015-.0035" (all others). **End Thrust:**—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".

Timing Chain:—Morse Type 1883N, No. 2661. Width 1". Pitch .500" (½"). Length 24" or 48 links.

Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.340-.341"	4 25/32"
Exhaust	1 17/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	⅜"	.0015-.0035"

See Chrysler Shop Notes for Exhaust Valve Seat Inserts.

Tappet Clearance:—.008" Intake, .010" Exh. (hot and idling), .002" additional exh. clearance desirable for sustained high speeds. NOTE—Tappet screws self-locking (no locknuts). Remove right front wheel and lower wheel housing panel for access to valves.

Valve Guides:—Remove from above. Press new guides in (stepped end down) with upper end ⅞" below top of block, finish ream (Tool CM-83) to .3425-.3435".

Valve Springs:—Install with closely coiled end to top.

Free length 2".	Spring Pressure	Length
Valve Closed	40- 45 lbs.	1¾"
Valve Open	107-115 lbs.	1⅜"

Valve Lifters:—Mushroom type (remove from below). Stem diam. ⅝". Ream holes from above (pilot in valve guide). Oversizes .001", .008", .030" & .060". **Lifter Clearance in Block**—.000-.001".

Valve Timing:—See Camshaft Setting above. **Intake Valves**—Open 12° BTDC. Close 44° ALDC. **Exhaust Valves**—Open 50° BLDC. Close 6° ATDC. **Valve Timing Check**—With .014" (cold) tappet clearance #6 intake valve should open with #6 piston to 12° or .063" BTDC with 12th graduation before DC mark on impulse neutralizer aligned with pointer on chain case cover. Reset tappet clear. at .008" hot.

LUBRICATION:—Pressure (pump on right of engine). *See Chrysler Shop Notes for Oil Pump Removal.* **Normal Oil Pressure:**—30-45 lbs. at 30 MPH and above. **Oil Pressure Relief Valve:**—Under plug below starter. Opens at 40-45 lbs. Spring painted red, green, or unmarked. If spring replaced, use same color spring. **Crankcase Capacity:**—5 quarts (refill).

COOLING SYSTEM:—**Capacity** 18 qts. *See Chrysler Shop Notes Radiator Core Removal & Water Distrib. Tube data.* **Water Pump:**—Packless type with grease fitting. *For complete data, refer to 1941 Mech. Equip. Index.* **Thermostat:**—Bishop & Babcock or Fulton. On cyl. hd. **Setting**—Starts to open 157-162°F. Fully open 183°F.

CLUTCH:—Borg & Beck Model 10A7 (Std.), 9A7 (with Fluid Drive), 11A6 (Taxi) with 'Borglite' driven member. Assembly No. 940 (10A7), 953 (9A7), 941 (11A6) stamped on cover. Single plate, dry disc type *For complete data, refer to 1941 Mech. Equip. Index.* **Facings**—Molded-Woven, 2 used. Inside Diam. 7" (10A7), 6" (9A7), 6½" (11A6). Outside Diameter 10" (10A7), 9¼" (9A7), 11" (11A6). Thickness .125" (⅛"). **Adjustment:**—Pedal should just clear toeboard (adjust stopscrew on lower end of pedal) & have 1" free travel (adjusting nut on connector link at fork). **Removal:**—Remove release fork pull-back spring, Transmission (see Transmission) and housing underpan. Pull out clutch release bearing and sleeve. Mark cover and flywheel (or driving plate on Fluid Drive). Take out cover screws, remove assembly.

FLUID DRIVE (OPTL.):—Fluid coupling at rear of engine. *For complete data, refer to Mech. Equip. Index.*

TRANSMISSION (STD.):—Own Make. All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote shift. *For complete data, refer to 1941 Mech. Equip. Index.* **Transmission Control:**—Steering column shift. Manual type Std., Power Shift (vacuum type) Optl. *For complete data, refer to 1941 Mech. Equip. Index.* **Removal:**—Jack up front end of car, disconnect front universal (loosen companion flange nut if disassembling transmission—see Chrysler Shop Notes for Propeller Shaft Center Bearing Removal on 7 pass.). Disconnect speedometer cable, hand brake cable, gear-shift rods, vacuum and air hose (if Power Shift used). Remove trans.-to clutch housing capscrews and nuts. Pull unit to rear, down and out of car. NOTE—Use pilot studs when installing assembly.

VACAMATIC (UNDERDRIVE TYPE) TRANSMISSION (OPTL.):—*For data, refer to Mech. Equip. Index.* **Transmission Control:**—Mech. steering column shift. *For complete data, refer to 1941 Mech. Equip. Index.* **Removal:**—Same as Std. Transmission (above) plus the following: Remove floor board, wires from vacuum unit solenoid, interrupter and governor switches, hose from vacuum unit air cleaner to vacuum unit. Take out vacuum unit (disconnect pullout cable and return spring and remove pivot pin).

UNIVERSAL JOINTS:—Detroit-Universal Series 7200. *For complete data, refer to 1941 Mech. Equip. Index.* **Propeller Shaft Center Bearing:**—Used on 7 passenger sedans. *See Chrysler Shop Notes for servicing.*

REAR AXLE:—Own Make. Semi-floating, Hypoid gear type with Hotchkiss drive. *For complete data, refer to 1941 Mech. Equip. Index.* **Ratio**—3.9-1 Std. 4.3-1 Std. 7 pass. 3.54-1 Vacamatic trans. (5 pass.), 3.91-1 (7 passenger). **Backlash**—.006-.010". Screw adjustment. **Removal:**—Disconnect rear universal, remove axle shafts (see below) and carrier assembly cap screws. **Axle Shaft Removal**—Remove wheel, hub, and drum assembly (use screw type hub puller—Tool C-319), block brake pedal, disconnect brake line at wheel cylinder, take off backing plate with oil seal, pull shaft and bearing (Tool C-158). NOTE—Use Tool C-358 to pull oil seal, drift C201 or 202 to install. **Wheel Bearing Adjustment:**—*See Chrysler C30 page.*

SHOCK ABSORBERS:—Domestic—Monroe Direct Acting, Delco (cars with 18" wheels). **Export**—Delco Direct acting or Adjustable Direct acting. *For complete data, refer to 1941 Mech. Equip. Index.*

STEERING:—Steering Gear—Chrysler (Gemmer design Models 305, 335 '3 tooth'—7 pass.) worm-and-roller types with 'push-pull' adjustment. *For complete data, refer to 1941 Mech. Equip. Index.* **Front Suspension:**—Independent, linked parallelogram type with coil springs. *For complete data, refer to 1941 Mech. Equip. Index.* **Kingpin Inclination**—4¾° to 6°. **Camber**—Positive ¼°. Limits 0° to Pos. ¾°. **Caster**—Negative 1° to Positive 1°. Not adjustable. **Toe In**—1/16" (0-⅛"). Turn both rods equally. **Steering Geometry**—Inner wheel 22°0'. Outer 20°.

BRAKES:—Service. Lockheed hydraulic, double anchor type. Hand lever applies independent shaft brake. *For complete data, refer to 1941 Mech. Equip. Index.* **Wheel Cylinders**—Stepped bore type (front only). **Drums**—Centrifuse. Diameter 11". **Lining**—Molded asbestos. 2" wide. 13/64" thick. Length (front shoe) 11 15/32", (rear shoe) 7 31/32". **Clearance**—.012" Toe (top), .006" Heel, for each shoe. **Braking Power**—60% front wheels, 40% rear. **Hand Brake:**—On drum at rear of transmission. **Adjustment**—*See Chrysler Shop Notes for instructions.* **Drum**—Cast-iron. Diameter 6", 7" (Vacam. Trans.). **Lining**—Width 2". Thick. 5/32". Length 17 1/16" (Std. trans.), 20⅛" (cars with Vacamatic Trans.).

HOOD LOCK:—Conventional center hinge hood. Each side locked by button under each end of instrument panel. Pull button out to unlatch hood side.
Control Cable Adjustment—Control button free play should be ⅛" max To adjust cable, pull control button, close side to be adjusted (open opposite side), adjust clamp at forward end of control cable for less than ⅛" free play (excessive free play allows wire stop to contact cable sheathing before latch is released).

FRONT END ASSEMBLY & OIL PAN REMOVAL:—*See Chrysler Shop Notes for directions.*

SERIAL NUMBER:—Stamped on plate on right front door hinge pillar post First number for each model·

C30 New Yorker	C33 Crown Imperial
6,624,101	7,807,501

ENGINE NUMBER:—First number C30-1001 (C30), C33-1001 (C33). Stamped on left side of cylinder block between Nos. 2 and 3 cylinders
See Chrysler Shop Notes for Engine Number Lettering data ('Special Standard' bore and bearing sizes).

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head type.
Bore—3¼". **Stroke**—4⅞".
Displacement—323 5 cubic inches.
Rated Horsepower—33 80 (A M A rating)
Developed Horsepower—137 HP at 3400 RPM (C30 with 6 8-1 std cast-iron head). 140 HP at 3400 RPM (C33 std , C30 optl , 6 8-1 aluminum head).
Compression Ratio—6 8-1 cast-iron head Std C30. 6.8-1 aluminum head Std. C33, Optl. C30
Compression Pressure—150-160 lbs. at 1000 RPM or 120-130 lbs at cranking speed of 125 RPM Reading should not vary more than 10 lbs between cylinders.
Vacuum Reading—Steady 18-20" idling at 6 MPH min for altitudes up to 1000 feet
See Chrysler Shop Notes for Engine Removal directions.

PISTONS:—Aluminum alloy, U-slot, cam ground, tin coated type.
Length—3⅞".
Weight—16 3 ozs. (stripped—piston only).
Removal—Pistons and rods removed from above.
Clearance—Head clearance at top land (difference in diameter) 022". Skirt .0000-.0010". See Fitting New Pistons (following).
Original Bore & Piston Sizes, Replacement Pistons:—*See Chrysler Shop Notes for sizes and markings.*
Fitting New Pistons:—Check piston size with micrometer calipers across large diameter (90° from pin bosses) at bottom of skirt. Insert .002" x ½" feeler stock (long enough to extend into bore for full length of piston) between cylinder wall and piston with piston inverted and pin removed Pull to withdraw feeler should be 5 to 7 lbs. with piston & block at 70°F.
NOTE—Cylinder maximum allowable taper .0015", out-of-round .002". Use hone to 'clean-up' cylinders, bore and hone for badly scored bores Reconditioned bores should be within limits of .0005" taper and .0005" out-of-round
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—Four rings per piston, all above pin. #1 Compression (upper inner edge stepped), #2 Compression (lower out edge stepped). #3 and #4 oil rings (slotted type).
NOTE—Compression rings are coated type.

Ring	Width	End Gap	Side Clearance
Comp. (top)	⅛"	007-.015"	.002-.0040"
Comp. (#2)	⅛"	.007-.015"	.0015-.0025"
Oil Control	5/32".	.007-.015"	.001-.0035"

Replacement Rings:—Std. & .003", .005", .010", 015", .020", .023", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2¾". Pin floats in piston and rod. Held by retaining ring at each end Pin hole in rod bronze bushed
Pin Fit in Piston—Thumb push fit with piston heated to 130° F.
Pin Fit in Rod Bushing—Thumb push fit at normal room temperature.
Replacement Pins:—Furnished standard size and .003", .005", .008" oversize.

CONNECTING ROD:—**Weight**—37 3 ounces (with bearings and bolts). **Length**—9".
Lower Bearing Diameter—2 3/16". *See Engine Lettering Note in Chrysler Shop Notes for 'Special Std.' size.*
Lower Bearing—Removable precision type, thin babbitt on steel
Clearance—001- 002". **Sideplay**—006- 011".
See Chrysler Shop Notes for Fitting Connecting Rod Bearings.
Bearing Adjustment:—None (no shims). Replace bearings Do not file rods or caps Install new bearings with boss engaging groove in rod and cap.
Replacement Bearings:—*See Chrysler Shop Notes.*
Installing Rods:—Lower bearings are offset Install rods with widest portion of bearing toward the rear on #1, #3, #5, and #7; toward the front on #2, #4, #6, and #8 All rods should be installed with oil metering hole in lower end toward camshaft.

CRANKSHAFT:—5 bearing type with 8 integral counterweights. Impulse neutralizer mounted on front
See Chrysler Shop Notes for Replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.
Bearing Diameters—2 45/64". *See Engine Lettering Note in Chrysler Shop Notes for 'Special Standard' size.*
Bearing Type—Removable, precision type, thin babbitt on steel.
Clearance—001- 002".
Bearing Adjustment:—*See Chrysler Shop Notes for bearing removal, front and rear main bearing cap removal, replacement bearing sizes and fitting data.*
End Thrust:—Taken by flange faces on rear (#5) main bearing.
Endplay—.003- 007".

CAMSHAFT:—6 bearing Non-adjustable chain drive.
See Chrysler Shop Notes for Camshaft Removal.
Bearing Diameters—#1, 2 1/16"; #2, 2 1/32"; #3, 2"; #4, 1 31/32"; #5, 1 15/16"; #6, 1⅜".
Bearing Type—Removable, steel-backed, babbitt-lined bushings (except #6 machined in crankcase).
Clearance—001-.003" (#1), .0015-.0035" (all others).
NOTE—Replacement bearings are finished (reaming, scraping or burnishing not required).
End Thrust:—Taken by thrust plate assembled behind camshaft sprocket.
Endplay—.002-.006".
Timing Chain:—Whitney No. 668983 center link guide type. Width 1¼". Pitch ½". Length 47 links or 23½".
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	340-.341"	5⅞"
Exhaust	1 11/32"	.340-.341"	5⅞"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	⅜"	.0015-.0035"

See Chrysler Shop Notes for Exhaust Valve Seat Inserts.

Tappet Clearance:—.008" Intake, .010" Exhaust (with engine running and at normal operating temperature). For cars to be driven at continuous high speeds an additional 002" exh clearance desirable.
NOTE—Tappet screws are self-locking type (no locknuts used). Remove right front wheel and lower wheel housing panel for access to valves
Valve Guides:—Remove from above. Press new guides in place with upper end 1" (Intake and Exhaust) below top face of cylinder block with taper end up (Intake), down (Exhaust) and ream (use Tool CM-83) to .3425-.3435" inside diameter. Counterbore exhaust guide at top to diameter of .365-.375" and ⅜" deep after guide installed in block.
Valve Springs:—Install with closely coiled ends at top. Free length 2 25/64".

	Spring Pressure	Spring Length
Valve Closed	52-58 lbs	2 1/32"
Valve Open	129-137 lbs	1 21/32"

NOTE—Use special valve spring tester tool MTR-67 for checking pressure before installing springs.
Valve Lifters:—Mushroom type (remove from below with oil pan, camshaft and valves out of engine). Stem diameter ⅝". Ream guide holes from above with valves out of engine (install reamer pilot of Tool C-265 in valve guide to insure alignment of lifter). Lifters furnished for service in standard and .001", .008", .030", 060" oversize.
Lifter Clearance in Block—000- 001".
Valve Timing:—See Camshaft Setting above
Intake Valves—Open 6° BTDC Close 50° ALDC
Exhaust Valves—Open 44° BLDC. Close 12° ATDC.
NOTE—Above figures correct with tappet clearance of 011" Intake, .014" Exhaust (cold).
Valve Timing Check—With .011" (cold) tappet clearance #8 intake valve should open with #8 piston 6° or 0170" BTDC with 6th graduation before DC mark on impulse neutralizer aligned with pointer on chain case cover. Reset tappet clearance at .008" (engine idling and at normal operating temperature). NOTE—Car manufacturer recommends use of Timing Indicator Tool C-435 (measures piston travel) inserted in timing hole in cylinder head over #8 piston.

LUBRICATION:—Pressure system with gear type oil pump mounted on right side of crankcase.
See Chrysler Shop Notes for Oil Pump removal and installation.
Normal Oil Pressure:—30-45 lbs at 30 MPH and above with proper viscocity oil and engine at normal operating temperature.
Oil Pressure Relief Valve:—Under cap on lower left side of crankcase. Adjustable To adjust, remove cap, withdraw lock wire, turn slotted plug clockwise to increase pressure, counter-clockwise to decrease pressure Relief valve opens at 40-45 lbs.
Crankcase Capacity:—6 quarts (refill).

COOLING SYSTEM:—**Capacity**—24 quarts.
See Chrysler Shop Notes for Radiator Core Removal and Water Distribution Tube Servicing.
Pressure Valve—In filler cap. Opens at 1½-2½ lbs.
Water Pump:—Packless type with sealed ball-bearing shaft. Grease fitting for seal lubrication
For complete data, refer to 1941 Mech. Equip. Index.
Removal—Drain cooling system, remove fan belt, loosen fan shroud-to-radiator core screws on left side, remove by-pass hose and elbow, disconnect pump inlet hose, remove pump-to-back plate screws, remove generator strap, lift out pump and fan assembly.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Thermostat:—Bishop & Babcock or Fulton. In cylinder head outlet elbow. Install with bellows down. **Setting**—Starts to open 157-162°F. Fully open 183°F.

Temperature Gauge:—Auto-Lite (Motometer) Vapor tension type. Auto-Lite Part No. H-9703.
For complete data, refer to 1941 Mech. Equip. Index.

Drain Valves:—Two drain valves used. To drain system, remove radiator pressure cap, open radiator drain cock and engine drain cock on left side.

CLUTCH:—Borg & Beck Model 10A6 with 'Borglite' driven member. Assembly No. 939 stamped on cover. Single plate, dry disc type with spiral grooved facings, pressure plate oil baffle and pedal overcenter return spring. Clutch assembly mounted on clutch driving plate at rear of fluid drive unit. NOTE—No spring dampener used on clutch driven member.
For complete data, refer to 1941 Mech. Equip. Index.

Adjustment:—Pedal should just clear underside of toeboard. To adjust, loosen locknut and turn stopscrew at lower end of pedal arm above shaft. Pedal free travel should be 1". To adjust, turn clutch release fork adjusting nut on connector link at clutch release fork.

Removal:—Remove transmission (see Transmission Removal instructions following). Remove clutch release bearing. Jack up rear of engine (to allow clutch housing pan to clear frame cross-member), remove clutch housing pan and dust shield. Mark clutch cover and clutch driving plate (assemble to these marks when reinstalling clutch assembly to maintain balance). Remove clutch cover-to-driving plate screws (release spring tension evenly by turning each screw out a few turns at a time). Clutch assembly and driven member can then be lowered out through pan opening.

FLUID DRIVE:—Consists of fluid coupling assembled to rear of engine in place of conventional flywheel.
For complete data, refer to 1941 Mech. Equip. Index.

Removal:—Remove clutch (see Clutch Removal directions above). Using special box wrench (Tool C-589) loosen fluid drive-to-crankshaft stud nuts, pull fluid drive unit back free from crankshaft flange, remove nuts. Withdraw fluid drive and clutch driving plate from clutch housing.

TRANSMISSION (STD. C30):—Own Make. All helical gear type, constant-mesh, synchro-mesh (second and high), sliding gear (low and reverse) with remote shift.
For complete data, refer to 1941 Mech. Equip. Index.

Transmission Control:—Steering column shift. Manually operated shift Standard, Power Shift (vacuum operated) Optional equipment.
For complete data, refer to 1941 Mech. Equip. Index.

Removal:—Jack up front end of car (use floor jacks under lower control arms). Disconnect front universal joint (loosen companion flange nut if transmission to be disassembled). Disconnect speedometer cable, hand brake cable at brake band, gearshift and gearshift selector control rods at transmission. If Power Shift used, disconnect vacuum and air hose and remove gearshift selector rod. Take out transmission-to-clutch housing cap screws and nuts. Pull transmission to rear, lower assembly out of car. NOTE—Use pilot studs when installing transmission to avoid springing clutch disc.

VACAMATIC (OVERDRIVE TYPE) TRANSMISSION (STD. C33, OPTL. C30):—New type 4 Speed & Reverse Transmission consisting of a two-speed manually controlled unit in conjunction with an Automatic Overdrive unit (Warner Model AS1-R7B) which provides two additional speeds.
For complete data, refer to 1941 Mech. Equip. Index.

Transmission Control:—Remote control, steering column mounted mechanical shift.
For complete data, refer to 1941 Mech. Equip. Index.

Removal:—Drain lubricant from transmission and overdrive cases. Remove propeller shaft by disconnecting front and rear universal joints (on cars with propeller shaft center bearing, free center bearing mounting from frame cross member). Loosen companion flange nut if disassembling transmission. Remove hand brake clevis pin from lower end of cable. Disconnect solenoid coil wires and remove coil. Disconnect speedometer cable and gear shifter rods from transmission, overdrive control cable clevis at overdrive case. Remove transmission-to-clutch housing cap screws and nuts, two upper studs (install two nuts on end of stud and turn stud out) and replace with pilot studs. Withdraw transmission and overdrive as an assembly.

UNIVERSAL JOINTS:—Detroit-Universal Series 7300. Cross type with roller bearings. Two used on C30. Three used with Center Bearing on C33.
For complete data, refer to 1941 Mech. Equip. Index.

Propeller Shaft Center Bearing (C33):—*See Chrysler Shop Notes for removal and installation data.*

REAR AXLE (C30):—Own Make. Semi-floating, Hypoid gear type with Hotchkiss drive.
For complete data, refer to 1941 Mech. Equip. Index.

Ratio—4.56-1 (standard), 3.91-1 (with Vacamatic Transmission).

Backlash—.006-.010". Screw adjustment.

Removal:—Drain differential by removing two lower carrier-to-axle housing cap screws (C30), drain plug at rear of bottom of axle housing (C33). Remove both axle shafts (see Axle Shaft Removal following). Remove rear universal joint flange bolts and lower propeller shaft. Take out carrier-to-axle housing capscrews (bolts and nuts used on C33) and lift out differential gear carrier assembly.

Axle Shaft Removal—Remove wheel, axle shaft cotter pin and nut. Remove hub and drum assembly (use screw type hub puller—Tool C-319 for C30, Tool C-476 for C33—do not loosen hub by striking end of axle shaft or roller bearings at each side of axle will be damaged). Block brake pedal at toe board. Disconnect brake line at wheel cylinder. Remove brake backing plate-to-axle housing bolt nuts and take off oil seal and backing plate. If both axle shafts removed, keep wheel bearing shims separated so they may be reassembled to proper side of axle when replacing to maintain bearing adjustment (if new parts used, axle shaft end play should be checked when parts replaced). Pull axle shaft and bearing using Tool C-158. NOTE—Use Tool C-358 to remove axle drive shaft bearing, Tool C-293 to remove axle drive shaft oil seal, special drift (Tool C-201 or C-202) to install oil seal.

Wheel Bearing Adjustment:—Adjusting shims located between flanged ends of axle housing and brake backing plate. Remove wheel and hub assembly (see Axle Shaft Removal above). Check endplay with dial indicator (make sure that brake bolts are tight and tap end of axle shaft so that bearing cups are seated). To adjust, remove oil seal and backing plate, add or remove shims (furnished .010", .0125", .015" and .030" thick) equally at both ends of axle housing (to maintain central position of axle shaft thrust block) until proper endplay obtained.
Endplay—.003-.008".

REAR AXLE (C33):—Own Make. Semi-floating, Hypoid gear type with Hotchkiss drive. Barrel type differential with adjustable drive gear thrust pad used.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—4.55-1.
All other data same as for C26 Rear Axle above.

SHOCK ABSORBERS:—Delco or Monroe. Direct acting, hydraulic types. FRONT Delco 1134-E (C33 Domestic & Export, C30 Export), 1000-C (C30 & C33 Export). REAR Delco 1130-W (C33 Domestic & Export), 1001-T (C30 & C33 Export). Delco Models 1130 and 1134 are Adjustable Direct Acting type.
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—Steering Gear—Chrysler (Gemmer design Model 335 '3 tooth' type) worm-and-roller with 'push-pull' adjustment.
For complete data, refer to 1941 Mech. Equip. Index.

Front Suspension:—Independent, linked parallelogram type with coil springs.
For complete data, refer to 1941 Mech. Equip. Index.
NOTE—Specifications listed below apply with car weight on wheels and no passenger or trunk load.
Kingpin Inclination—4¾° to 6°.

Camber—Positive ¼° (preferred). Limits 0° to Positive ¾°.

Caster—Negative 1° to Positive 1°. Not adjustable.

Toe In—1/16" (preferred). Limits 0" to ⅛". Adjust by loosening clamp bolts on ends of both tie rods and turning rods equally, tighten clamp bolts. Make this adjustment with steering gear in mid-position. NOTE—Clamp bolt on left end of long tie rod should be turned below tie rod to give clearance for extreme turns.

Steering Geometry (toe-out on turns)—Inner wheel turned 21°30' with outer wheel turned 20°.

BRAKES:—Service—(Front Wheels)—Lockheed hydraulic, Two-Cylinder type (front shoe anchored at bottom and actuated by top cylinder, rear shoe anchored at top and actuated by bottom cylinder).

(Rear Wheels)—Lockheed hydraulic, double anchor type. Hand lever applies independent propeller shaft brake.
For complete data, refer to 1941 Mech. Equip. Index.

Wheel Cylinders—Straight cut bore type. Piston assembly (with spring) used. Bore diameter 1⅛".

Drums—Centrifuse. Diameter 12".

Lining—Molded asbestos. Width 2". Thickness 13/64". Length—Rear wheel rear shoe 9⅝". Front wheel front and rear shoes and Rear wheel rear shoe 12 9/16".

Clearance—Toe (wheel cylinder end) .007" for all shoes. Heel (anchor bolt end) .006" for all shoes except rear wheel rear shoes which is .007".

Braking Power—61% front wheels, 39% rear wheels.

Hand Brake:—On drum at rear of transmission.
Adjustment—*See Chrysler Shop Notes for instructions.*
Drum—Cast-iron. Diameter 7".
Lining—Width 2½". Thickness 5/32". Length 20⅛".

Power Brake Unit (C33):—Bendix Internal Valve Type.
For complete data, refer to 1941 Mech. Equip. Index.

ENGINE REMOVAL NOTE:—Engine removal from chassis required for all service work. *See Crosley Special Shop Notes for removal directions.*

SERIAL NUMBER:—First number 390-30000. Stamped on front face of cowl below battery shelf (in engine compartment).

ENGINE NUMBER:—First number C-21000. Stamped on top center of engine block at rear of carburetor.

ENGINE SPECIFICATIONS (1941):—Waukesha. Two cylinder, 'L' head, horizontal opposed, air-cooled type with shrouded cylinders and air circulating fan built in flywheel.

Bore—3". Stroke—2½". Rated Horsepower—7.2.

Displacement—35.3 cubic inches.

Developed Horsepower—12 at 4000 RPM.

Compression Ratio—5.6-1.

Compression Pressure—80 lbs. at cranking speed.

Vacuum Reading—No means of connecting gauge.

PISTONS:—Electric furnace cast iron. Matched for equal weight within ⅛ oz.

Weight—17.5 ozs. (with pin). **Length—2.807".**

Removal—Pistons & rods removed from above with engine out of chassis. *See Crosley Special Shop Notes for engine removal instructions.*

Clearance—.004-.0055". See Fitting Pistons.

Fitting New Pistons:—Use feeler gauges installed between piston and cylinder wall at right angles to pin hole. Piston should pass through bore on .004" feeler and lock on .0055" feeler.

Replacement Pistons:—Finished pistons furnished Standard and .010", .020" Oversize.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Compr. #1	⅛"	.010-.015"	.002-.0035"
Compr. #2	⅛"	.010-.015"	.0015-.003"
Oil Control	5/32"	.010-.018"	.001-.0025"

NOTE—Install oil ring with scraper edge down.

Replacement Rings:—Furnished Standard and .010", .020" Oversize.

PISTON PIN:—Diameter ¾". Pin floats in piston and rod, held by locking ring at each end.

Pin Fit in Piston—.0002" clearance or thumb push fit at normal temperature.

Pin Fit in Rod Bushing—.0004" clearance. Ream new bushings for this clearance.

Replacement Pins:—Std. and .005", .010" oversize.

CONNECTING ROD:—Weight 18 ozs. **Length 4¾".**

Lower Bearing—Removable steel-backed, babbitt lined type.

Crankpin Journal Diameter—1⅞".

Clearance—.0025". Sideplay—.008".

Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.

Replacement Bearings:—Furnished Std. and .003" undersize. Install bearings with locating lugs fitted in notches in rod and cap. NOTE—Bearings can be renewed through pan opening without removing engine from chassis.

CRANKSHAFT:—Two bearing, counterweighted type. *See Crosley Special Shop Notes for Engine Removal directions for main bearing and crankshaft oil seal servicing.*

Journal Diameters—Front 1 13/16", Rear 2¼".

Bearing Type—Steel-backed, babbitt-lined bushings (not split). Front bearing mounted in timing gear housing cover.

Clearance—.001-.003" (frt.), **.0015-.003"** (rear).

Adjustment:—None. Replace bearings. *See Crosley Special Shop Notes for Crankshaft Removal directions.*

End Thrust:—Taken by rear bearing. Adjustable by replacing fiber thrust washer. **Endplay—.003-.005".**

CAMSHAFT:—Proferal (alloy iron). Two bearing, gear driven.

Bearing Type—Removable bushing in rear cover (front), machined in crankcase (rear).

Clearance—.001-.003".

Endplay—.006-.009". Controlled by timing gear. *See Crosley Special Shop Notes for Camshaft Removal and front bushing servicing data.*

Timing Gears:—Allowable runout .001". To renew gears, remove camshaft (see Crosley Shop Notes for data), use puller to remove old gears.

Camshaft Setting:—Mesh gears so that 'C' mark on camshaft gear and punchmark on crankshaft gear line up (install gears with these marks forward).

VALVES:—	Head Diameter	Stem Diameter
Intake	1⅜"	5/16"
Exhaust	1 5/32"	5/16"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.300"	.002-.003"
Exhaust	45°	.300"	.003-.004"

Tappet Clearance:—.006-.0065" Intake, .008-.0085" Exhaust, Cold. Not adjustable. NOTE—After grinding valves, check tappet clearance with feeler gauge. Grind off end of valve stem if clearance less than minimum above.

Valve Springs:—Free length 1 27/32".

	Pressure	Length
Valve Closed	20 lbs.	1½"
Valve Open	41 lbs.	1 15/64"

Valve Guides:—Guides can be removed and renewed with engine out of car and dismantled (See Shop Notes for engine removal directions). Ream new guides with 5/16" reamer for correct stem clearance (above).

Valve Lifters:—Mushroom type. Remove from below with camshaft out of engine (see Shop Notes for Camshaft removal directions).

Lifter Clearance—.0005-.0015".

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 20° BTDC. Close 60° ALDC.
Exhaust Valves—Open 60° BLDC. Close 20° ATDC.

To Check Valve Timing—Intake valve should open when point on flywheel 5.5 teeth before TDC mark (half round notch on rim of flywheel) lines up with small ribcast on top center of crankcase. Exhaust closing point is 5.5 teeth past TDC point.

LUBRICATION:—Pressure to crankshaft, connecting rod and camshaft bearings.

Oil Pump:—Rotary vane type mounted on timing gear cover and driven directly from camshaft.

Removal—Take out 4 screws mounting pump on timing gear cover, remove pump. Serviced by replacement. Use new gasket when installing pump.

Normal Oil Pressure:—35-45 lbs. with warm oil.

Oil Pressure Regulator:—On timing gear case cover. Adjustable by varying valve spring tension (increase tension to increase oil pressure).

Crankcase Capacity:—3 quarts.

COOLING:—Air-cooled by suction fan built in flywheel which draws air past cylinder barrel and head fins through ducts formed by shroud bolted over cylinders.

Cooling Fan Capacity—700 cu. ft. of air per minute at 3600 R.P.M.

CLUTCH:—Rockford. Single plate dry disc type.
For complete data, refer to 1941 Mech. Equip. Index.

Facings—Not furnished separately (each facing consists of 4 segments).

Adjustment:—Clutch pedal free travel should be 1.5". To adjust, loosen locknut and turn clevis on connector cable at lower end of throw-out yoke.

Removal:—Remove transmission (see Transmission Removal below) and rear axle as an assembly (do not disconnect drive shaft at rear of transmission case as for transmission removal only). Disconnect clevis at bottom of clutch yoke, remove throw-out bearing from top of yoke, take out six capscrews mounting clutch lever brackets on flywheel, remove clutch assembly.

TRANSMISSION:—Warner Model AS1-T92. Sliding spur gear type (all speeds).
For complete data, refer to 1941 Mech. Equip. Index.

NOTE—Transmission has Adaptor (Crosley No. 200957) bolted on rear which adapts transmission to new 1941 type Torque Tube and Propeller Shaft Assembly (with Universal Joint in ball housing on rear face of Adaptor). This Adaptor is also the Rear Engine Mounting.

Removal (1941):—Disconnect shock absorber links and brake cables and conduits at backing plates. Hoist rear of car to remove weight from springs, disconnect springs at rear axle. Disconnect speedometer cable and clutch cable clamp on bottom of transmission case, take off control housing and remove shift lever assembly. Take out capscrews in universal joint ball housing on transmission adaptor, pull rear axle and torque tube assembly to rear to disengage propeller shaft at universal joint **being careful not to lose washer and spring on shaft at rear of speedometer gear.** Support rear of engine, take out bolts in rear engine mounting. Take out four capscrews mounting transmission on flywheel housing, pull transmission straight back and remove.

UNIVERSAL JOINT:—Spicer No. 102. One used. In ball housing at rear of transmission adapator.
For complete data, refer to 1941 Mech. Equip. Index.

REAR AXLE:—Spicer (Salisbury) Model 11. Semi-floating spiral bevel gear type with Torque Tube drive.
For complete data, refer to 1941 Mech. Equip. Index.

Ratio—5.14-1 or **5.57-1.**

Backlash—.004-.008". Shim adjustment.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Removal (1941):—Disconnect shock absorber links and brake cables and conduits at backing plates. Hoist rear of car to remove weight from springs, disconnect springs at rear axle. Take out capscrews in universal joint ball housing on transmission adaptor, pull rear axle and torque tube assembly to rear to disengage propeller shaft at universal joint **being careful not to lose washer and spring on shaft at rear of speedometer gear.** Remove axle assembly from beneath car.

Axle Shaft Removal—Remove hub cap, wheel, axle nut, pull hub (use puller No. 202318). Disconnect brake cable and conduit on backing plate, take out four capscrews and remove backing plate being careful not to lose bearing adjusting shims (between backing plate and axle housing flange). Pull axle and bearing out.

Wheel Bearing Adjustment:—Check endplay with dial indicator. Adjust by removing backing plate (see Axle Shaft Removal above) and adding or removing shims between backing plate and axle housing.

Endplay—.002-.007" between shaft and thrust block (total for both shafts).

TORQUE TUBE & PROPELLER SHAFT ASSEMBLY:—Spicer No. 98-1182X. Shaft is supported by bearing at center of torque tube and has splined end to engage rear axle pinion shaft (rear end), universal joint (front end). Front end of torque tube has been modified to include a ball housing for the universal joint and adaptor is used between the torque tube and the transmission case (rear engine mounting is located on adaptor).

SHOCK ABSORBERS:—Delco Model 1201G, H (front), 1201J, K (rear). Single acting, hydraulic type.
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—Steering Gear—Ross Model S-12. Cam-and-Lever type.
For complete data, refer to 1941 Mech. Equip. Index.

Front Suspension:—Conventional 'I' beam section front axle with reverse Elliott ends and semi-elliptic springs.

Kingpin Inclination—6°30' crosswise.

Camber—2°. No adjustment provided.

Caster—6½-11°. No adjustment provided.

Toe In—3/64-1/16". Adjust in usual manner by loosening tie rod clamp bolts and turning rod.

BRAKES:—Service—Hawley. Four wheel, mechanical type with 'floating' lining. Hand lever applies all four service brakes.
For complete data, refer to 1941 Mech. Equip. Index.

Drum Diameter—6".

Lining—Width 1". Thickness 5/32". Length 18⅜" per wheel. NOTE—Lining furnished in correct length to fit loosely around shoe assembly with 1/16-⅛" gap at ends (not riveted on shoes).

Clearance—Just clear of drag.

Hand Brake:—See Service Brakes above.

CROSLEY SPECIAL SHOP NOTES

ENGINE REMOVAL FOR SERVICING (1941):—Engine should be removed from chassis for all major service work as follows: Disconnect battery ground cable, distributor cables, choke and throttle connections, oil gauge tube line at engine. Close shut-off valve at gasoline tank on Coupe models. On all models, disconnect gas line at carburetor. Remove exhaust pipe (connecting manifold and muffler), accelerator bracket, generator, starting motor (accessible by removing plate in driver's compartment). Disconnect clutch cable bracket on transmission case, clutch cable clevis at clutch yoke, speedometer cable at transmission. Block up front end of car and remove front axle assembly and wheels (see below). Drain oil, remove oil pan and oil suction tube. Block up engine and transmission, remove hold-down bolts in front motor support and free rear support. Take out capscrews mounting transmission on flywheel housing, pull engine forward. Disconnect torque tube at adaptor on rear of transmission case, remove transmission. Lower engine to floor, raise front end of car, remove engine from below.

Engine Installation—Install engine in same manner. Check ignition timing if distributor disturbed.

PISTON & CONNECTING ROD REMOVAL:—With engine removed from chassis (above), take out 7 Phillips screws in each shroud, remove shrouds from cylinders. Remove cylinder heads and oil pan. Take out connecting rod bearing cap screws, push piston & rod assembly out through cylinder barrel.

CAMSHAFT REMOVAL:—With engine removed from chassis (above), remove intake and exhaust manifolds, cylinder shrouds (retained by Phillips screws), cylinder heads and oil pan. Remove connecting rod and piston assemblies, gear housing cover (with oil pump), and valve cover. Block up valves by placing 5/16"x¾" capscrew between crankcase and spring washer on each valve, pull camshaft and timing gear assembly out through front of crankcase.

CRANKSHAFT REMOVAL:—For Main Bearing & Crankshaft Oil Seal Servicing. With engine removed from chassis (above), dismantle engine and remove camshaft (see Camshaft Removal above). Take out 4 capscrews mounting flywheel on crankshaft flange, pull flywheel. Pull crankshaft out through front end of crankcase by hand.

Main Bearing Renewal—Drive old bearings out (rear bearing in crankcase, front bearing in gear housing cover), drive new bearing bushings in place. Bearings are precision type and need not be reamed.

Oil Seal Renewal—Drive old oil seals out of crankcase (rear), gear housing cover (front) with drift pin. Use mandril or hardwood block to drive new seals in place. CAUTION—When installing crankshaft use care not to damage leather oil seals.

CAMSHAFT BUSHING RENEWAL:—Take out 8 capscrews in gear housing cover and Phillips screws in oil pan which enter gear cover, remove gear cover. Drive or press camshaft bushing out of timing gear cover and install new bushing in same manner.

NOTE—Rear camshaft bushing is integral with crankcase and cannot be serviced.

FRONT WHEEL & AXLE ASSEMBLY REMOVAL: For Engine Removal from chassis. Raise front end of car until front wheels clear floor, disconnect brake cables at levers on backing plates and cable conduit from backing plate clamps. Disconnect drag link at pitman arm, disconnect shock absorber links at axle. Remove front spring 'U' bolts at axle. Hoist front end of car and roll wheel and axle assembly out from under car.

HOOD LOCK, FRONT END ASSEMBLY & OIL PAN REMOVAL:—*See Chrysler Shop Notes.*

SERIAL NUMBER:—On right front door hinge post. First number: Detroit—5,720,401 (Custom), 6,096,001 (Deluxe). Canada—9,373,196 (Custom).

ENGINE NUMBER:—First number S8-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Shop Notes for engine number lettering data ('Special Standard' bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3⅜". **Stroke**—4¼".
Displacement—228.1 cu. ins. **Rated HP**—27.34.
Developed Horsepower—105 HP (Std. 6.8-1 head), 108 HP (Optl. 7.2-1 hd.—Std. 7 pass.) at 3600 RPM.
Compression Ratio and Pressure—As follows:

Ratio	Pressure at 1000 RPM	At 125 RPM
6.8-1 cast-iron head	145-155 lbs.	115-125 lbs.
7.2-1 aluminum head	150-160 lbs.	120-130 lbs.

Vacuum Reading—Steady 18-20" idling (below 1000'). *See Chrysler Shop Notes for engine removal directions.*

PISTONS:—Aluminum alloy, U-slot, cam ground, tin coated. **Length**—3⅞". **Weight**—17.5 ozs. (stripped). **Removal**—Pistons and rods removed from above. **Clearance**—Top .023". Skirt .0000-.0010".
Original Bore & Piston Sizes, Replacement Pistons:—*See Chrysler Shop Notes for sizes and markings.*
Fitting New Pistons:—Check piston size with micrometer across large diameter at bottom of skirt. Insert .002" x ½" feeler between cylinder wall and piston (inverted, pin removed) on side opposite slot. Feeler pull 5-7 lbs. (with piston and block at 70° F.).
Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—4 rings, all above pin #1 Compression (upper inner edge stepped), #2 Comp. (lower outer edge stepped), #3 & 4 (slotted oil rings).

Ring	Width	End Gap	Side Clearance
Comp. (Top)	⅛"	.007-.015"	.002-.004"
Comp. (#2)	⅛"	.007-.015"	.0015-.0035"
Oil Control	5/32"	.007-.015"	.001-.0025"

Replacement Rings:—Std. & .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2⅞". Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit (piston at 130°).
Pin Fit in Rod Bushing—Thumb push fit at 70°F.
Replacement Pins:—Std. & .003", .005", .008" oversize.

CONNECTING ROD:—**Weight**—35.2 ozs. (with bearings and bolts). **Length**—8".
Lower Bearing Diameter—2⅛". *See Engine Lettering Note in Chrysler Shop Notes for 'Special Standard' size.*
Lower Bearing—Removable, precision type, thin babbit on steel.
Clearance—.0005-.0025". **Sideplay**—.0055-.0115".
Bearing Adjustment:—None (no shims). Replace bearings. *See Chrysler Shop Notes for instructions.*
Replacement Bearings:—*See Chrysler Shop Notes.*
Installing Rods:—Oil metering hole toward camshaft.

CRANKSHAFT:—4 bearing type with 7 counterweights. *See Chrysler Shop Notes for Replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.*
Bearing Diameters—2½". *See Engine Lettering Note in Chrysler Shop Notes for 'Special Standard' size.*
Bearing Type—Removable, precision type, thin babbitt on steel. **Clearance**—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for bearing removal, replacement sizes and adjustment data.*
End Thrust:—Taken by flange faces on rear (#4) main bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive. *See Chrysler Shop Notes for Camshaft Removal.*
Bearing Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #4 machined in block).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
End Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Morse Type 1883N, No. 2661. Width 1". Pitch .500" (½"). Length 24" or 48 links.
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.340-.341"	4 25/32"
Exhaust	1 17/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	⅜"	.0015-.0035"

See Chrysler Shop Notes for Exhaust Valve Seat Inserts.
Tappet Clearance:—.008" Intake, .010" Exh. (hot and idling), .002" additional exh. clearance desirable for sustained high speeds. NOTE—Tappet screws self-locking (no locknuts). Remove right front wheel and lower wheel housing panel for access to valves.
Valve Guides:—Remove from above. Press new guides in (stepped end down) with upper end ⅞" below top of block, finish ream (Tool CM-83) to .3425-.3435".
Valve Springs:—Install with closely coiled end to top.

Free length 2".	Spring Pressure	Length
Valve Closed	40- 45 lbs.	1¾"
Valve Open	107-115 lbs.	1⅜"

Valve Lifters:—Mushroom type (remove from below). Stem diam. ⅝". Ream holes from above (pilot in valve guide). Oversizes .001", .008", .030" & .060".
Lifter Clearance in Block—.000-.001".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 12° BTDC. Close 44° ALDC.
Exhaust Valves—Open 50° BLDC. Close 6° ATDC.
Valve Timing Check—With .014" (cold) tappet clearance #6 intake valve should open with #6 piston 12° or .059" BTDC with 12th graduation before DC mark on impulse neutralizer aligned with pointer on chain case cover. Reset tappet clear. at .008" hot.

LUBRICATION:—Pressure (pump on right of engine). *See Chrysler Shop Notes for Oil Pump Removal.*
Normal Oil Pressure:—30-45 lbs. at 30 MPH and above.
Oil Pressure Relief Valve:—Under plug below starter. Opens at 40-45 lbs. Spring painted red, green, or unmarked. If spring replaced, use same color spring.
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—**Capacity** 18 qts. *See Chrysler Shop Notes Radiator Core Removal & Water Distrib. Tube data.*
Water Pump:—Packless type with grease fitting. *For complete data, refer to 1941 Mech. Equip. Index.*
Thermostat:—Bishop & Babcock or Fulton. On cyl. hd. **Setting**—Starts to open 157-162°F. Fully open 183°F.

CLUTCH:—**Borg & Beck Model 10A7 (Std.), 9A7 (with Fluid Drive), 11A6 (Taxi) with 'Borglite' driven member.** Assembly No. 957 (10A7), 952 (9A7), 931 (11A6) stamped on cover. Single plate, dry disc type *For complete data, refer to 1941 Mech. Equip. Index.*
Facings—Molded-Woven, 2 used. Inside Diam. 7" (10A7), 6" (9A7), 6½" (11A6). Outside Diameter 10" (10A7), 9¼" (9A7), 11" (11A6). Thickness .125" (⅛").
Adjustment:—Pedal should just clear toeboard (adjust stopscrew on lower end of pedal) & have 1" free travel (adjusting nut on connector link at fork).
Removal:—Remove release fork pull-back spring, Transmission (see Transmission) and housing underpan. Pull out clutch release bearing and sleeve. Mark cover and flywheel (or driving plate on Fluid Drive). Take out cover screws, remove assembly.

FLUID DRIVE (OPTL.):—Fluid coupling at rear of engine. *For complete data, refer to Mech. Equip. Index.*

TRANSMISSION (STD.):—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote shift. *For complete data, refer to 1941 Mech. Equip. Index.*
Transmission Control:—Steering column shift. Manual type Std., Power Shift (vacuum type) Optl. *For complete data, refer to 1941 Mech. Equip. Index.*
Removal:—Jack up front end of car, disconnect front universal (loosen companion flange nut if disassembling transmission—see Chrysler Shop Notes for Propeller Shaft Center Bearing Removal on 7 pass.). Disconnect speedometer cable, hand brake cable, gear-shift rods, vacuum and air hose (if Power Shift used). Remove trans.-to clutch housing capscrews and nuts. Pull unit to rear, down and out of car. NOTE—Use pilot studs when installing assembly.

SIMPLIMATIC (UNDERDRIVE TYPE) TRANSMISSION (OPTL.):—*For data, refer to Mech. Equip. Index.*
Transmission Control:—Mech. steering column shift. *For complete data, refer to 1941 Mech. Equip. Index.*
Removal:—Same as Std. Transmission (above) plus the following: Remove floor board, wires from vacuum unit solenoid, interrupter and governor switches, hose from vacuum unit air cleaner to vacuum unit. Take out vacuum unit (disconnect pullout cable and return spring and remove pivot pin).

UNIVERSAL JOINTS:—**Mechanics Type 2CR (new type), Detroit-Universal Series 7200 (7 pass. only).** *For complete data, refer to 1941 Mech. Equip. Index.*
Propeller Shaft Center Bearing:—Used on 7 passenger sedans. *See Chrysler Shop Notes for servicing.*

REAR AXLE:—**Own Make.** Semi-floating, Hypoid gear type with Hotchkiss drive. *For complete data, refer to 1941 Mech. Equip. Index.*
Ratio—4.1-1 Std. 4.3-1 Std. 7 pass. 3.54-1 Simplimatic trans. (5 pass.), 3.91-1 (7 pass.).
Backlash—.006-.010". Screw adjustment.
Removal:—Disconnect rear universal, remove axle shafts (see below) and carrier assembly cap screws.
Axle Shaft Removal—Remove wheel, hub, and drum assembly (use screw type hub puller—Tool C-319), block brake pedal, disconnect brake line at wheel cylinder, take off backing plate with oil seal, pull shaft and bearing (Tool C-158). NOTE—Use Tool C-358 to pull oil seal, drift C201 or 202 to install.
Wheel Bearing Adjustment:—*See Dodge D19 page.*

SHOCK ABSORBERS:—**Delco**—Direct Acting (Domestic). Adjustable Direct Acting type (Export). *For complete data, refer to 1941 Mech. Equip. Index.*

STEERING:—**Steering Gear**—Chrysler (Gemmer design Models 305, 335 '3 tooth'—7 pass.) worm-and-roller types with 'push-pull' adjustment. *For complete data, refer to 1941 Mech. Equip. Index.*
Front Suspension:—Independent, linked parallelogram type with coil springs. *For complete data, refer to 1941 Mech. Equip. Index.*
Kingpin Inclination—4¾° to 6°.
Camber—Positive ¼°. Limits 0° to Pos. ¾°.
Caster—Negative 1° to Positive 1°. Not adjustable.
Toe In—1/16" (0-⅛"). Turn both rods equally.
Steering Geometry—Inner wheel 22°0'. Outer 20°.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand lever applies independent shaft brake. *For complete data, refer to 1941 Mech. Equip. Index.*
Wheel Cylinders—Stepped bore type (front only).
Drums—Cast-iron. Diameter 11".
Lining—Molded asbestos. 2" wide. 13/64" thick. Length (front shoe) 11 15/32", (rear shoe) 7 31/32".
Clearance—.012" Toe (top), .006" Heel, for each shoe.
Braking Power—60% front wheels, 40% rear.
Hand Brake:—On drum at rear of transmission.
Adjustment—*See Chrysler Shop Notes for instructions.*
Drum—Cast-iron. Diameter 6", 7" (Simplimatic).
Lining—Width 2". Thick. 5/32". Length 17 1/16" (Std.), 20⅛" (Cars with Simplimatic Trans.).

HOOD LOCK, FRONT END ASSEMBLY & OIL PAN REMOVAL:—*See Chrysler Shop Notes.*

SERIAL NUMBER:—On right front door hinge post. First number: 30,342,401 (Detroit), 9,422,901 (Canada).

ENGINE NUMBER:—First number D19-1001. Stamped on left side of block between #1 and #2 cylinders. *See Chrysler Shop Notes for engine number lettering data ('Special Standard' bore and bearing sizes).*

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3¼". **Stroke**—4⅜". **Displacement**—217.8 cu. ins. **Rated HP**—25.35. **Developed Horsepower**—91 HP at 3800 RPM. **Compression Ratio**—6.5-1 cast-iron head std. **Compression Pressure**—140-150 lbs. at 1000 RPM or aproximately 113 lbs. at cranking speed. **Vacuum Reading**—Steady 18-20" idling (below 1000'). *See Chrysler Shop Notes for Engine Removal directions.*

PISTONS:—Aluminum alloy, cam ground, split skirt, steel strut, tin coated type. **Length**—3 11/16". **Weight**—15.2 ounces (stripped). **Removal**—Pistons and rods removed from above. **Clearance**—Top (diff. in diam.) .028". Skirt .00025-.00075".

Original Bore & Piston Sizes, Replacement Pistons:—*See Chrysler Shop Notes for sizes and markings.*

Fitting New Pistons:—Check piston size with micrometer at bottom of skirt adjacent to slot. Insert .0015 x ½" feeler between cylinder wall and piston (inverted with pin removed) opposite slot. Pull to withdraw feeler 10-17 lbs. (piston & block at 70°F.).

Installing Pistons:—Slot away from camshaft.

PISTON RINGS:—4 rings, all above pin—#1 Compression (upper inner edge stepped), #2 Comp. (lower outer edge stepped), #3 and #4 (slotted oil rings).

Ring	Width	End Gap	Side Clearance
Compr. (Top)	3/32"	.007-.015"	.0025-.004"
Compr. (#2)	⅛"	.007-.015"	.0015-.0035"
Oil Control	5/32"	.007-.015"	.001-.0025"

Replacement Rings:—Std. & .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2¾". Floating type. Pin hole in rod bronze bushed. **Pin Fit in Piston**—Thumb push fit (piston at 160°F.). **Pin Fit in Rod Bushing**—Thumb push fit at 70° F. **Replacement Pins:**—Std. & .003", .005", .008" oversize.

CONNECTING ROD:—**Weight**—30.4 ozs. (with bearings and bolts). **Length**—7 15/16". **Lower Bearing Diameter**—2 1/16". *See Engine Lettering Note in Chrysler Shop Notes for 'Special Std.' size.* **Lower Bearing**—Removable, precision type, thin babbitt on steel. **Clearance**—.0005-.002". **Sideplay**—.0055-.0115". **Bearing Adjustment:**—None (no shims). Replace bearings. *See Chrysler Shop Notes for instructions.* **Replacement Bearings:**—*See Chrysler Shop Notes.* **Installing Rods:**—Wide portion of bearing to rear (#1, 3, 5) to front (#2, 4, 6). Oil hole to camshaft.

CRANKSHAFT:—4 bearings, 7 integral counterweights. *See Chrysler Shop Notes for Replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.* **Bearing Diameters**—2½". *See Engine Lettering Note in Chrysler Shop Notes for 'Special Standard' size.* **Bearing Type**—Removable, precision type, thin babbitt on steel. **Clearance**—.001-.0025". **Bearing Adjustment:**—*See Chrysler Shop Notes for bearing removal, replacement sizes and adjustment data.* **End Thrust:**—Taken by flange faces on rear (#4) main bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive. *See Chrysler Shop Notes for Camshaft Removal.* **Bearing Diameters**—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼". **Bearing Type**—Removable steel-backed, babbitt-lined bushings (except #4 machined in block). **Clearance**—.001-.003" (#1), .0015-.0035" (all others). **End Thrust:**—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006". **Timing Chain:**—Morse Type 1883N, No. 2661. Width 1". Pitch .500" (½"). Length 24" or 48 links. **Camshaft Setting:**—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:

	Head Diameter	Stem Diameter	Length
All Valves	1 15/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	⅜"	.001-.003"
Exhaust	45°	⅜"	.003-.005"

See Chrysler Shop Notes for Exhaust Valve Seat Inserts. **Tappet Clearance:**—.008" Intake, .010" Exh. (hot and idling), .002" additional exh. clearance desirable for sustained high speeds. NOTE—Tappet screws self-locking (no locknuts). Remove right front wheel and lower wheel housing panel for access to valves. **Valve Guides:**—Remove from above. Press new guides in (stepped end down) with upper end ⅞" below top of block, finish ream (Tool CM-83) to .342-.343" Intake, .344-.345" Exhaust.

Valve Springs:—Install with closely coiled end to top.

	Spring Pressure	Length
Free length 2".		
Valve Closed	40- 45 lbs	1¾"
Valve Open	107-115 lbs	1⅜"

Valve Lifters:—Mushroom type (remove from below). Stem diam. ⅝". Ream holes from above (pilot in valve guide). Oversizes .001", .008", .030" & .060". **Lifter Clearance in Block**—.000-.001". **Valve Timing:**—See Camshaft Setting above. **Intake Valves**—Open 9° BTDC. Close 47° ALDC. **Exhaust Valves**—Open 47° BLDC. Close 9° ATDC. **Valve Timing Check**—With .014" (cold) tappet clearance #6 intake valve should open with #6 piston 9° or .0343" BTDC with 9th graduation before DC mark on impulse neutralizer aligned with pointer on chain case cover. Reset tappet clear. at .008" hot.

LUBRICATION:—Pressure (pump on right of engine). *See Chrysler Shop Notes for Oil Pump Removal.* **Normal Oil Pressure:**—30-45 lbs. at 30 MPH and above. **Oil Pressure Relief Valve:**—Under plug below starter. Opens at 40-45 lbs. If spring replaced, same colored spring should be used (Std. not colored). **Crankcase Capacity:**—5 quarts (refill).

COOLING SYSTEM:—**Capacity** 15 qts. *See Chrysler Shop Notes Radiator Core Removal & Water Distrib. Tube data.* **Water Pump:**—Packless type with grease fitting. *For complete data, refer to 1941 Mech. Equip. Index.* **Thermostat:**—Bishop & Babcock or Fulton. On cyl. hd. **Setting**—Starts to open 157-162°F. Fully open 183°F.

CLUTCH:—**Borg & Beck Model 10A7 (Std.), 9A7 (with Fluid Drive), 11A6 (Taxi) with 'Borglite' driven member.** Assembly No. 928 (10A7), 952 (9A7), 931 (11A6) stamped on cover. Single plate, dry disc type with spiral grooved facings and pressure plate oil baffle (10A7, 11A6). *For complete data, refer to 1941 Mech. Equip. Index.* **Facings**—Molded-Woven, 2 used. Inside Diam. 7" (10A7), 6" (9A7), 6½" (11A6). Outside Diameter 10" (10A7), 9¼" (9A7), 11" (11A6). Thickness .125" (⅛"). **Adjustment:**—Pedal should just clear toeboard (adjust stopscrew on lower end of pedal) & have 1" free travel (adjusting nut on connector link at fork). **Removal:**—Remove release fork pull-back spring, Transmission (see Transmission) and housing underpan. Pull out clutch release bearing and sleeve. Mark cover and flywheel (or driving plate on Fluid Drive). Take out cover screws, remove assembly.

FLUID DRIVE (OPTL.):—Fluid coupling at rear of engine. *For complete data, refer to Mech. Equip. Index.*

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote shift. *For complete data, refer to 1941 Mech. Equip. Index.* **Transmission Control:**—Steering column shift. Manually operated Std., Power Shift (vacuum operated) Optl. *For complete data, refer to 1941 Mech. Equip. Index.* **Removal:**—Jack up front end of car, disconnect front universal (loosen companion flange nut if disassembling transmission—see Chrysler Shop Notes for Propeller Shaft Center Bearing Removal on 7 pass.). Disconnect speedometer cable, hand brake cable, gear-shift rods, vacuum and air hose (if Power Shift used). Remove trans.-to clutch housing capscrews and nuts. Pull unit to rear, down and out of car. NOTE—Use pilot studs when installing assembly.

UNIVERSAL JOINTS:—**Detroit-Universal Series 4200 (3 & 5 pass.), Series 7200 (7 pass.).** Roller bearings, ball and trunnion type (4200), cross type (7200). *For complete data, refer to 1941 Mech. Equip. Index.* **Propeller Shaft Center Bearing:**—Used on 7 passenger sedans. *See Chrysler Shop Notes for servicing.*

REAR AXLE:—**Own Make.** Semi-floating, Hypoid gear type with Hotchkiss drive. *For complete data, refer to 1941 Mech. Equip. Index.* **Ratio**—4.3-1 Sedans (5 & 7 pass.), 4.1-1 Coupes. **Backlash**—.006-.010". Screw adjustment. **Removal:**—Disconnect rear universal, remove axle shafts (see below) and carrier assembly cap screws. **Axle Shaft Removal**—Remove wheel, hub, and drum assembly (use screw type hub puller—Tool C-319), block brake pedal, disconnect brake line at wheel cylinder, take off backing plate with oil seal, pull shaft and bearing (Tool C-158). NOTE—Use Tool C-358 to pull oil seal, drift C201 or 202 to install. **Wheel Bearing Adjustment:**—Shims between backing plate and axle housing. With wheel and hub removed, check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .010", .0125", .015", .030" thick) equally at both wheels. **Endplay**—.003-.008".

SHOCK ABSORBERS:—**Delco.** Direct Acting (Domestic), Adjustable Direct Acting type (Export). *For complete data, refer to 1941 Mech. Equip. Index.*

STEERING:—**Steering Gear**—Chrysler (Gemmer design Models 305, 335 '3 tooth'—7 pass.) worm-and-roller types with 'push-pull' adjustment. *For complete data, refer to 1941 Mech. Equip. Index.* **Front Suspension:**—Independent, linked parallelogram type with coil springs. *For complete data, refer to 1941 Mech. Equip. Index.* **Kingpin Inclination**—4¾° to 6°. **Camber**—Positive ¼°. Limits 0° to Pos. ¾°. **Caster**—Negative 1° to Positive 1°. Not adjustable. **Toe In**—1/16" (0-⅛"). Turn both rods equally. **Steering Geometry**—Inner wheel 22°0'. Outer 20°.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand lever applies independent shaft brake. *For complete data, refer to 1941 Mech. Equip. Index.* **Wheel Cylinders**—Stepped bore type (front only). **Drums**—Cast-iron. Diameter 11". **Lining**—Molded asbestos. 2" wide. 13/64" thick. Length (front shoe) 11 15/32", (rear shoe) 7 31/32". **Clearance**—.012" Toe (top), .006" Heel, for each shoe. **Braking Power**—60% front wheels, 40% rear.

Hand Brake:—On drum at rear of transmission. **Adjustment**—*See Chrysler Shop Notes for instructions.* **Drum**—Cast-iron. Diameter 6". **Lining**—Width 2". Thick. 5/32". Length 17 1/16".

MERCURY NOTE:—All '95' Engine data below applies to Mercury as well as Ford models with '95' Engine.

OIL PAN REMOVAL:—To remove oil pan, drain cooling system, disconnect upper and lower radiator hoses, disconnect exhaust pipe and remove cross-pipe, disconnect radius rods at rear end, push rear end of rods down and block in this position. Remove front engine support bolts, attach hoist and raise front end of engine. Remove oil pan screws, remove pan. NOTE—Pan removal will be facilitated by removing starter motor and engine side pans, disconnecting steering tie rod, and turning crankshaft so that #4 piston is at top dead center.

CYLINDER SLEEVES:—Replaceable dry type hardened cylinder sleeves used in production for all Ford 4 Cyl., '85' and Mercury Engines. Engines with sleeves can be identified by letter 'HS' stamped on top of block beside inner front corner of left cylinder hd.

Servicing:—To recondition engines with cylinder sleeves, sleeves should be replaced. Car manufacturer recommends use of KRW #6055A Sleeve Puller and Replacer (sleeves should not be pressed in with arbor press). **Sleeves furnished in standard size and should be fitted with new standard size pistons only.**

Model	Cylinder Sleeves	Part No.
4 Cyl. Eng.	.040"	99A-6055
'85' Engine	.040"	91A-6055
'95' Engine	.040"	99A-6055
'95' Engine	.060"	09A-6055

Fitting Pistons on Sleeve Equipped Engines:—Special gauge thicknesses used (not same as for engines without sleeves). See Piston Fitting Instructions on car model 'M' pages for data.

REPLACEMENT PISTONS:—Finished aluminum pistons furnished for service in following oversizes:

Passenger Car & Truck Pistons (3 Ring)

'85' Eng. — Part No.	'95' Eng.	Size
01A-6110-A	09A-6110-A	Standard
01A-6110-B	09A-6110-B	.0025" Oversize
01A-6110-C	09A-6110-C	.005" Oversize
01A-6110-D	09A-6110-D	.015" Oversize
01A-6110-E	09A-6110-E	.030" Oversize
01A-6110-F	09A-6110-F	.045" Oversize
01A-6110-G	09A-6110-G	.060" Oversize

Part No.	4 Cyl. Engine Piston	Size
99A-6110-A		Standard

Piston Fitting Note—Steel and aluminum pistons not fitted with same clearance (different feelers must be used) and pistons also fitted differently when sleeves not used. See Piston fitting instructions on car model 'M' pages for data.

REPLACEMENT PISTON PINS:—Pins furnished for service in Standard Size and in Under- and Oversizes which are color-marked for identification as follows:

Part No.	4 Cyl. Engine Color	Size
99A-6135-A		Standard
99A-6135-D	Blue	.001" Oversize
	'85' Engine	
48-6135-A①		Standard
48-6135-B①	Red	.002" Oversize
48-6135-C①	White	.002" Undersize
48-6135-D②	Blue	.001" Oversize
	'95' Engine	
99A-6135-A		Standard
99A-6135-B	Red	.002" Oversize
99A-6135-C	White	.002" Undersize

①—For steel pistons and '95' Truck with 99T Aluminum pistons. ②—For 91A, 99T Aluminum pistons.

REPLACEMENT PISTON RINGS:—Rings furnished only as sets in cartons for V8 '85' and '95' engines as listed below. For 4 Cyl. Engine, rings furnished separately (8 Compression, 4 Oil Rings required).

Part No.	4 Cyl. Engine Type	Size
99A-6150-A	Compression	Standard
99A-6150-B	Oil	Standard

'85' Engine
Aluminum Pistons

Part No. (See Note)		Size
81A-6149-A or 81AS-6149-A		Standard
81A-6149-B		.005" Oversize
81A-6149-C	81AS-6149-F	.015" Oversize
81A-6149-D	81AS-6149-B	.030" Oversize
81A-6149-E	81AS-6149-C	.045" Oversize
81A-6149-F	81AS-6149-D	.060" Oversize

Steel Pistons

81A-6149-G	81AS-6149-E	Standard

'95' Engine

99A-6149-A	99AS-6149-A	Standard
99A-6149-B		.005" Oversize
99A-6149-C	99AS-6149-E	.015" Oversize
99A-6149-D	99AS-6149-B	.030" Oversize
99A-6149-E	99AS-6149-C	.045" Oversize
99A-6149-F	99AS-6149-D	.060" Oversize

Part No. Note—Second part number listed above ('AS' prefix) is special 'steel section' type ring.

CONNECTING ROD BEARING SERVICING:—Bearings float between connecting rods and crankpin. Special Replacement bearings furnished oversize on outer diameter (for oversize rods) and undersize on inner diameter (undersize crankpins) as follows:

'85' & '95' Engines

Part Numbers		Con. Rod	Crankpin
85 Eng.	95 Eng.	Oversize	Undersize
81-A-6211-A	99-A-6211-A	Std.	Std.
81-A-6211-B	99-A-6211-J	Std.	.003"
81-A-6211-C	99-A-6211-K	Std.	.010"
81-A-6211-D	99-A-6211-B	.004"	.003"
81-A-6211-E	99-A-6211-C	.008"	.010"
81-A-6211-F	99-A-6211-D	.008"	.003"
81-A-6211-G	99-A-6211-E	.004"	.010"
————	99-A-6211-F	Std.	.015"
81-A-6211-J	99-A-6211-G	.004"	Std.
81-A-6211-K	99-A-6211-H	.008"	Std.
81-A-6211-L	99-A-6211-L	Std.	.0015"
81-A-6211-M	99-A-6211-M	Std.	.020"

Part No.	4 Cyl. Engine	Size
9N-6211 (8 used—4 double halves)		Standard

CRANKSHAFT BEARINGS:—Replacement bearings furnished in Standard Size and Undersizes as shown below. In addition, Rear Main Bearings (flanged on both ends—take crankshaft end thrust) furnished in special lengths as follows:

'85' & '95' Engines

Part Numbers		
Frt. & Center	Rear	Size
81-A-6333-A	81-A-6331-A	Standard
81-A-6333-B	81-A-6331-B	.005" Undersize
81-A-6333-C	81-A-6331-C	.010" Undersize
————	81-A-6331-D①	Standard
————	81-A-6331-E①	.005" Undersize
————	81-A-6331-F①	.010" Undersize
81-A-6333-D	81-A-6331-G	.015" Undersize
81-A-6333-E②	81-A-6331-H②	Standard
81-A-6333-F	81-A-6331-J	.020" Undersize
81-A-6333-G③	81-A-6331-K②	.010" Undersize

①—Length .015" Oversize. ③—O.D. .015" Oversize.
②—O.D. .015" Oversize. .010" Undersize in length.

Front & Rear	4 Cyl. Engine Center	Size
9N-6333	9N-6331	Standard

PISTON PIN FITTING:—Steel Pistons. Pins can be removed and installed without heating pistons. Pins, pistons, and rod bushings held to close limits so no fitting required. Check clearance as follows:
Pin Fit in Piston—With piston and pin at same temperature and clean, pin should drop through pin hole in piston (clearance .0007" maximum).
Pin Fit in Rod Bushing—With pin installed, hold pin so that rod hangs vertically, then rotate pin. Lower end of rod should move upward through arc of ½" max. before dropping back to vertical.

Aluminum Pistons:—Pistons must be heated by immersion in boiling water for one minute, or on special piston heater to a temperature not to exceed 200°F. for pin removal and installation. Pins, pistons, and rod bushings held to close limits so that no fitting required. Check clearances as follows:
Pin Fit in Piston—Pin should be hard hand push fit in piston with piston at room temperature.
Pin Fit in Rod Bushing—Same as for steel pistons

TIMING GEARS (FORD 85, 95 & MERCURY):—New type bolted-on Aluminum Alloy Camshaft Gear used on all V8 Engines. Gear can be replaced without removing camshaft from engine as follows:

Camshaft Gear (Aluminum Alloy Type):—Gear is bolted on camshaft hub flange by four offset capscrews. To remove gear, remove screw in front end of crankshaft, pull fan and pulley assembly (use puller 6312-A), remove timing gear cover. Bend back lockplate tangs, take out four camshaft gear mounting screws, remove gear. When replacing gear, make certain that marks on camshaft and crankshaft gears are lined up and see that lockplate tangs are bent up against flats on mounting screws. Use 6312-B Pulley Replacer to install pulley and fan. NOTE—Camshaft gear mounting screw holes offset so gear can only be installed in correct position.

VALVE SERVICING (ALL FORD AND MERCURY ENGINES):—Complete valve assembly (valve, spring, guide) should be removed as follows:

Valve Assembly Removal:—Use special bar type lifter V-78 (All Fords and Mercury) inserting the end of lifter through valve spring coils to engage flanged lower end of guides, pull guide down slightly, withdraw 'C' type guide retainer, lift valve assembly out through top of block.

Valve Assembly Dismantling:—Use special bench fixture Part No. V-130 (All Engines). Fixture consists of special press by which valve spring can be compressed to free spring retainer (fixture has stop which prevents excessive valve spring compression).

Valve Grinding and Tappet Clearance Note for all V8 Models):—To perform these operations with minimum amount of hand cranking, note which valves are fully open (first column in table below), grind or check valves listed on same line of table—then turn shaft 'til next 'valve open' point reached.

Valves Open	Valves to Grind
1. 4X & 1N	3X, 8N, 6N, 7X, 3N, 2X
2. 3X & 8N	1X, 7N, 5X, 2N, 4X, 1N
3. 1X & 7N	8X, 5N, 6X, 4N
OR	
1. 8X & 5N	1X, 7N, 6N, 7X, 3N, 2X
2. 6N & 7X	5X, 2N, 4X, 1N, 8X, 5N
3. 5X & 2N	6X, 4N, 3X, 8N

NOTE—'X' Exhaust Valve. 'N' Intake Valve.

Tappet Clearance Checking (All Models):—Use special two-step feeler to check clearance with valve lifter on heel of cam (see above). First .0125" step should be 'go', second .0135" 'no go'.

Valve Seat Insert Grinding Note:—Valve seat inserts are exceedingly hard (high-tungsten, chrome-alloy steel). Manufacturer recommends eccentric-grinding equipment be used to reface these inserts.

TRUCK NOTE:—All Engine data below applies also to Ford Truck Models with '85' engine. See Ford Truck 'M' page (following) for other data.

ENGINE HOOD NOTE:—Hood is Alligator type with release knob under instrument panel to left of steering column. To raise hood, pull out on release knob (hood will raise slightly), press in on safety catch under front edge of hood.

OIL PAN REMOVAL:—*See Ford Shop Notes for data.*

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left frame member in front of dash bracket.

ENGINE SPECIFICATIONS (11A,C):—**Own 85,** 8 cyl., 90° Vee, L head. Both banks & crankcase cast Enbloc. **Bore**—3.062". **Stroke**—3.75".
Rated Horsepower—30. **Displacement** 221 cu. ins.
Developed Horsepower—85 at 3800 R.P.M.
Compression Ratio—6.20-1 (Pass. Cars, Comm. ¾&1 Ton), 5.9-1 (Other Trucks). Cast iron head.
Compression Pressure—140 lbs. (6.20-1 hd.), 130 lbs. (5.9-1 hd.) at 2400 RPM. max. 100 lbs. at 100 RPM.
Vacuum Reading—Steady 18-20" at 5-7 MPH.

ENGINE SPECIFICATIONS (1NC, 19C):—See Ford Truck 'M' page (following) for engine data on Model 1NC with 4 Cylinder Engine, see Mercury 'M' page for 19C with V8 '95' engine.

CYLINDER SLEEVES:—Hardened, dry type cylinder sleeves used on engines marked 'HS' on cylinder block beside inner front corner of left cylinder head.
Servicing:—*See Ford Shop Notes for complete data.*

PISTONS:—Steel alloy, light weight, cam ground type or Aluminum alloy, T slot type. Recondition engine to take finished replacement pistons (replace sleeves, install Std. pistons. See Sleeve Note).
Weight—333-337 grams (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Replacement Pistons:—*See Ford Shop Notes for data.*
Fitting New Pistons:—Use .50" wide feeler stock of correct thickness inserted between piston and cylinder wall at right angles to pin to check clearance. Pull to withdraw feeler should be 6-10 lbs.

Feeler Thickness	Steel — Pistons — Aluminum
Engines with Sleeves	.003" — .0025"
Engines without Sleeves	.0025" — .002"

PISTON RINGS:—Two compression, one slotted oil ring, all above pin (drain holes in oil ring groove).
NOTE—Expander used with #2 Compr. and oil ring.

Ring	Width	End Gap	Side Clearance
Compr. #1	.0915-.0920"	.012-.017"	.0025-.003"
Compr. #2	.0915-.0920"	.012-.017"	.002-.0025"
Oil Contr	.1535-.1540"	.012-.017"	.0015-.002"

Replacement Rings:—*See Ford Shop Notes for data.*

PISTON PIN:—**Diameter**—.7501-.7504". **Length**—2.850" (steel pistons), 2.780" (aluminum pistons). Floating type. Pin hole in rod bronze-bushed.
Pin Fit in Piston:—.0005" clearance (steel pistons), + .0001" to — .0001" (aluminum pistons).
Pin Fit in Rod Bushing—.0001" clearance. *See Ford Shop Notes for Pin Fitting directions and Oversizes.*

CONNECTING ROD:—**Length** 7.002". **Weight** 476 grams.
Crankpin Journal Diameter—1.999" (connecting rod diameter on crankpin—2.220").
Bearing Type—Steel-backed, special-alloy lined. Bearing floats in both rods (side-by-side mounting) with bearing surface on inner and outer faces.
Bearing Dimensions—Length 1.747". Thick. .1095".
Clearance—.0005-.002" (total diametrical).
Sideplay—.010-.022" (total).
Bearing Adjustment:—None (no shims). Do not file.
Replacement Bearings:—*See Ford Shop Notes for special bearings for oversize rods and undersize crankpins.*
Installing Rods:—Marks on rods and caps must be together and installed in same numbered cylinder with marks pointing down toward oil pan.

CRANKSHAFT:—3 bearing. Integral counterweights.
Journal Diameters—2.499" (all bearings).
Bearing Type—Steel-backed, special-alloy lined.
Clearance—.001-.003" (or slight drag with .002" feeler assembled in bearing for clearance check).
Bearing Adjustment:—None (no shims). Do not file.
End Thrust:—Taken by rear main bearing. Adjust by replacing bearing. **Endplay**—.002-.006".
Replacement Bearings:—*See Ford Shop Notes for Undersizes and special long main bearings.*

CAMSHAFT:—Three bearing. Helical gear drive.
Bearing Diameters—1.797" (all bearings).
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.002".
End Thrust:—Taken by gear hub and cover plate. Adjusted by replacing coverplate. **Endplay**—.005-.015".
Timing Gears:—Cast alloy iron (crankshaft), Bakelized Fabric—pressed on shaft, or Aluminum Alloy—bolted on shaft (camshaft). **Backlash**—.004" max. *See Ford Shop Notes for Timing Gear Replacement.*
Camshaft Setting:—Mesh '0' marked tooth of crankshaft gear with '/' marked space on camshaft gear (this mark must be in line with mark on hub).

VALVES:

	Head Diameter	Stem Diameter	Length
All Valves	1.537"	.3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.292"	.0015-.0035"

See Ford Shop Notes for Valve Servicing data.
NOTE—Seat insert used for all valves.
Tappet Clearance:—.0125-.0135". No adjustment.
Valve Guides:—Split type retained by 'C' washer and valve spring. *See Ford Shop Notes for servicing data.*
Valve Lifters:—Barrel type in reamed holes in block. **Diameter**—.9995". **Clearance**—.0005-.001".

Valve Springs:	Pressure	Length
Valve Closed	37-40 lbs.	2.13"
Valve Open	76-80 lbs.	1.84"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 6° ATDC.
To Check Valve Timing—No flywheel marks provided. Intake valve opens with piston at TDC.

LUBRICATION:—Pressure. Gear type oil pump mounted in crankcase at rear of engine.
Normal Oil Pressure:—30 lbs. at 2000 R.P.M.
Oil Pressure Regulator:—Under plug above front camshaft bearing. Opens at 30 lbs. Not adjustable.
Oil Pressure Gauge:—King-Seeley Electric. Ford No. Dash Unit—11A-9273 (Pass. Cars), 11C-9273A (Comm'l.), 11C-9273B (Sedan Dlvry.). Engine Unit —No. 48-9278 (all models).
For complete data, refer to 1941 Mech. Equip. Index.
Crankcase Capacity:—5 quarts.

COOLING SYSTEM:—**Capacity**—26¼ qts. (Pass. Cars), 22 qts. (Commercial), 14 qts. (4 Cyl. Commercial).
Water Pump:—Packless type, 2 used (1 for each bank). *See Mechanical Equipment Section for data.*
Thermostat:—In each cylinder head outlet (2 used). **Setting**—Start to open at 145°F. Fully open 180°.
Temperature Gauge:—King-Seeley Electric. Ford No. Dash Unit—11A-10883 (Pass. Cars), 11C-10883A (Comm'l), 11C-10883B (Sedan Delivery). Engine Unit—99A-10884 (all models).
For complete data, refer to 1941 Mech. Equip. Index.

CLUTCH:—**Long Model 9CF-CS.** Semi-centrifugal, single plate, dry disc type. *Refer to Mech. Equip. Index.*
Facings—Molded type, 2 required. Inside Diam. 5.76". Outside Diam. 9". Thickness .137".
Adjustment:—Pedal free movement should be 1.0-1.25". To adjust, remove clevis pin at end of connector rod, adjust clevis on rod.
Removal:—Slide rear axle and transmission to rear as a unit to expose clutch (see Transmission Removal below), take out mounting screws in cover.

TRANSMISSION:—**Own Make.** Constant-mesh, synchro-mesh (Second & High), sliding gear (low & reverse), all helical gear type. NOTE—Four speed spur gear type optional on Commercial Models.
For complete data, refer to 1941 Mech. Equip. Index.
Transmission Control (11A):—Remote control type.
For complete data, refer to 1941 Mech. Equip. Index.
Removal:—Disconnect gear shifter rods at levers on transmission (Pass. Cars), disconnect rear shock absorbers, hand brake cables, hydraulic brake line at torque tube connection (bleed lines when reconnected), and speedometer cable. Disconnect rear spring at center frame connection, take out universal joint ball housing screws, slide rear axle assembly back to disengage drive shaft at splined joint. Support rear of engine, take out rear engine mounting bolts, clutch housing screws & transmission.

UNIVERSAL JOINT:—**Spicer 202-6 (Std.), 202-8 (Comm'l. with 4 Spd. Trans.).** Steel bushing type. 1 used.
For complete data, refer to 1941 Mech. Equip. Index.

REAR AXLE:—**Own Make.** ¾ floating, Spiral Bevel gear type with Torque Tube drive.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—3.78-1 Std.; 3.54-1, 4.11-1 Optl. (V8), 4.55-1 (4 Cyl.). **Backlash**—.012" max.
Optional Axle:—Columbia Two-speed type.
For complete data, refer to 1941 Mech. Equip. Index.
Removal:—Disconnect rear shock absorbers, hand brake cables, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable. Disconnect rear spring at center frame connection, take out universal joint ball housing screws, pull axle assembly to rear.
Axle Shaft Removal—*Refer to Mechanical Equipment Index for Ford Rear Axle article for data.*

SHOCK ABSORBERS:—**Houde (Houdaille).** Double acting, adjustable, hydraulic type.

Houde Model	Right—Ford No.	Left
Pass.Car (Frt.) BBCN	11A-18045A	11A-18046A
" (Rear) BBCZ	11A-18080A	11A-18081A
Comm'l. (Frt). BBCME	01A-18045B	01A-18046B
" (Rear) BBCZ	01A-18080A	01A-18081A

For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—**Steering Gear**—Ford make, same as Gemmer Model 305 Worm & Roller type. See Gemmer.
For complete data, refer to 1941 Mech. Equip. Index.
Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and transverse front spring. Axle positioned by radius rods.
Kingpin Inclination—8° crosswise.
Caster—9° Max., 4½° Min. Equal within ½°.
Camber—1° Max., ¼° Min. Must be equal within ¼° and the right wheel must not exceed the left. Axle may be bent cold to adjust caster & camber if proper tools (to prevent axle flange damage) used.
Toe In—1/16". Set at 1-10 ratio to Camber. Adjust by loosening tie rod clamp bolts and turning tie rod.
Steering Geometry—Inner wheel 23⅓°. Outer 20°.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand lever applies rear wheel service brakes.
For complete data, refer to 1941 Mech. Equip. Index.
Drums—Cast iron. Diameter 12".
Wheel Cylinders—Stepped or two- stage bore type:
Front Wheel—Front cylinder 1.25". Rear 1.00".
Rear Wheel—Front cylinder 1.125". Rear 1.00".
Lining—Woven (forward shoes), Molded (rear shoes). Width 1.75". Thickness .20". Length per shoe 13.18" (forward shoes), 10.1" (rear shoes).
Clearance—Least possible amount without drag.
Hand Brake:—See Service Brakes above.

MODEL DESIGNATION:—Truck and Commercial models for 1941 with Engine Type and Wheelbase in which each model furnished are as follows:

Commercial Models

Model	Engine	Wheelbase
1NC	4 Cyl.	112"
11C	85 V8	112"
19C	95 V8	118"

See Passenger Car 'M' page (preceding) for all data on the above models except 4 Cylinder Engine.

¾ Tonner

Model	Engine	Wheelbase
1ND	4 Cyl.	122"
11D	85 V8	122"
19D	95 V8	122"

1 Tonner

1NY	4 Cyl.	122"
11Y	85 V8	122"
19Y	95 V8	122"

Cab-over-Engine Models

111W	85 V8	101"
11W	85 V8	134"
118W	85 V8	158"
19W	95 V8	134"
198W	95 V8	158"

Other Models

11T, U	85 V8	134"
118T	85 V8	158"
114T (School Bus)	85 V8	194"
19T, U	95 V8	134"
198T	95 V8	158"
194T (School Bus)	95 V8	158"

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing at rear of engine.

ENGINE SPECIFICATIONS & SERVICE DATA (V8 85 & 95 ENGINES):—*See Ford '85' Passenger Car 'M' page and Mercury 'M' page (for '95' Engine) for complete data.* All data (Cylinder Sleeves, Pistons, Pins, Rings, Connecting Rods, Main Bearings, Camshaft & Valves) same as for Passenger Cars except as noted in each section. All other data (including Lubrication & Cooling) given below.

ENGINE SPECIFICATIONS (4 CYL. ENGINE):—4 Cylinder, 'L' head, Enbloc type.

Bore—3.187". **Stroke**—3.75".

Displacement—119.5 cubic inches.

Rated Horsepower—16.2.

Developed Horsepower—30 at 2800 RPM.

Compression Ratio—6.0-1. Cast iron Head.

Compression Pressure—130 lbs. at 1000 RPM. or 100 lbs. at cranking speed of 100 RPM.

Vacuum Reading—18-20" steady idling at 5-7 MPH.

CYLINDER SLEEVES:—Hardened, dry type, cylinder sleeves used on all engines.

Servicing—*See Ford Shop Notes for complete data.*

PISTONS (4 CYL.):—Steel alloy, light weight, cam ground type. When reconditioning engine, replace cylinder sleeves and install new Std. pistons.

Weight—358-362 grams (without rings or pin).

Removal—Pistons and rods removed from above.

Clearance—See Fitting New Pistons.

Fitting New Pistons:—Use .003" feeler, .50" wide, inserted between piston and cylinder wall at right angles to pin. Pull required to withdraw feeler must be within 6-10 lbs.

PISTON RINGS (4 CYL.):—Two compression, one slotted oil control ring, all above pin. Oil ring groove drilled for oil drainage.

Ring	Width	End Gap	Side Clearance
Compr. #1	.0915-.0920"	.012-.017"	.0025-.003"
Compr. #2	.0915-.0920"	.012-.017"	.002-.0025"
Oil Contr.	.1535-.1540"	.012-.017"	.0015-.002"

Replacement Rings:—*See Ford Shop Notes for data.*

PISTON PIN (4 CYL.):—**Diameter**—.7501-.7504". **Length**—2.975". Floating type with locking ring in piston at each end. Pin hole in rod bronze-bushed.

Pin Fit in Piston—.0005" clearance.

Pin Fit in Rod Bushing—.0001" clearance. *See Ford Shop Notes for Piston Pin Fitting directions.*

CONNECTING ROD (4 CYL.):—**Length**—6.125".

Crankpin Journal Diameter—2.10".

Bearing Type—Removable steel-backed, special alloy lined type, clamped in rod and bearing cap. **Clearance**—.0005-.002". **Sideplay**—.002-.006".

Adjustment:—None (no shims). Replace bearings. Do not file rods or bearing caps.

CRANKSHAFT (4 CYL.):—Three bearing type with integral counterweights.

Journal Diameters—2.25".

Bearing Type—Removable, steel-backed, special alloy lined. Front & Rear bearings interchangeable. **Clearance**—.001-.003" (or slight drag with .002" feeler assembled in bearing for clearance check).

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.

End Thrust:—Taken by center bearing. Adjust by replacing bearing. **Endplay**—.002-.006".

CAMSHAFT (4 CYL.):—Three bearing with Helical Gear drive (gear furnished as unit with shaft).

Timing Gears:—Cast alloy iron (crankshaft), Bakelized fabric—pressed on shaft (camshaft).

Gear Backlash—.004" maximum.

Camshaft Setting:—Mesh '0' marked tooth of crankshaft gear with '/' marked space between teeth on camshaft gear (camshaft gear mark must be in line with mark on gear hub).

VALVES (4 CYL.):

	Head Diam.	Stem Diam.	Length
Intake	1.537"	.3115"	4.750-4.751"
Exhaust	1.281"	.3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.307"	.0015-.0035"

See Ford Shop Notes for valve servicing data.

NOTE—Seat inserts used for all valves.

Tappet Clearance:—.0125-.0135" all valves. No. adj.

Valve Guides:—Split type retained by 'C' washer and valve springs. *See Ford Shop Notes for servicing data.*

Valve Lifters:—Barrel type in reamed holes in block. **Diameter**—.9995". **Clearance**—.0005-.001".

Valve Springs:—	Pressure	Length
Valve Closed	51-57 lbs.	2.13"

Valve Timing:—See Camshaft Setting above.

LUBRICATION:—Pressure system. Gear type oil pump in crankcase. Pump mounted on right side of front main bearing cap with pump housing integral with bearing cap (4 Cyl.), mounted separately at rear of crankcase (V8 Engines).

Normal Oil Pressure:—25 lbs. (4 Cyl. Eng.), 30 lbs. at 2000 RPM. (V8 Eng.) with warm oil.

Oil Pressure Regulator:—Opens at 25 lbs. (4 Cyl. Eng.), 30 lbs. (V8 Eng.). Not adjustable. Located under plug between cylinder banks at front of engine (V8 Engines).

Oil Pressure Gauge:—King-Seeley Electric. Ford No. 11C-9273A (Dash Unit), 48-9278 (Eng. Unit).
For complete data, refer to 1941 Mech. Equip. Index.

Crankcase Capacity:—4 qts. (4 Cyl.), 5 qts. (V8).

COOLING SYSTEM:—**Capacity**—14 qts. (All 4 Cyl.), 22 qts. (¾ & 1 Ton), 24 qts (Cab-over-Engine Trucks), 23 qts. (All other Trucks).

Water Pump (4 Cyl. Eng.):—Packless type, 1 used. Mounted on front end of cylinder block and driven by fan belt (fan mounted on front end of water pump shaft).
For complete data, refer to 1941 Mech. Equip. Index.

Removal—Remove drive belt, take out mounting bolts and remove fan. Take out pump mounting screws and remove pump assembly.

Water Pump (V8 Engines):—Packless type, 2 used (1 for each bank). Mounted on front of engine block.
For complete data, refer to 1941 Mech. Equip. Index.

Removal—Slack off drive belt, support engine at forward end, remove front engine mounting bolts (engine mounting integral with pump housing), take out mounting screws in pump body.

Thermostat:—In top radiator hose (4 Cyl. Eng.—1 used), in each cylinder head outlet elbow (V8 Engines—2 used).

Setting—Starts to open at 145° F. Fully open 180°F.

Temperature Gauge:—King-Seeley Electric. Ford No. 11C-10883A (Dash Unit), 99A-10884 (Eng. Unit).
For complete data, refer to 1941 Mech. Equip. Index.

CLUTCH:—**Long Model 9CF-CS (4 Cyl. Models), 11CF-CI (All Others).** Single plate, dry disc, Semi-centrifugal type.
For complete data, refer to 1941 Mech. Equip. Index.

Facings—Molded type, 2 required. Inside Diam. 5.76" (9CF), 6.5" (11CF). Outside Diam. 9" (9CF), 11" (11CF). Thickness .137" (all).

Adjustment:—Pedal free movement should be 1.5-1.75". To adjust, remove clevis pin at end of connector rod, adjust clevis on rod.

Removal:—Remove transmission (see Transmission Removal below). Take out mounting screws in clutch cover flange.

TRANSMISSION (3 SPD.):—**Own Make.** Std. on all ¾ Ton and on 1 Ton with V8 Engine (4 Spd. type Std. on 1 Ton with 4 Cyl. Engine). Constant-mesh, synchro-mesh, helical gears (Second & High), sliding spur gears (Low & Reverse).
For complete data, refer to 1941 Mech. Equip. Index.
NOTE—4 Spd. Transmission Optl. on these models.

Removal:—Remove 4 front companion flange bolt nuts at front universal. Take out 2 bolt nuts at coupling shaft center support (all except 101" WB.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Cab-Over-Engine). Lower propeller shaft assembly to floor. Support engine at rear end, take out rear engine mounting bolts and clutch housing mounting screws. Pull transmission straight back and remove.

TRANSMISSION (4 SPD.):—Own Make. Std. on all models except ¾ Ton and 1 Ton (with V8 Engine). Sliding spur gear type.
For complete data, refer to 1941 Mech. Equip. Index.
NOTE—This Transmission Opti. on other models.

Removal:—Same as for 3 Spd. Transmission above.

UNIVERSAL JOINT:—Spicer. Needle bearing types. Two used (101" WB. models), 3 used with slip-joint in center behind coupling shaft bearing (122", 134", 158", 194" WB. models).
For complete data, refer to 1941 Mech. Equip. Index.

Spicer Model Nos.

Wheelbase	Front	Center	Rear
101"	1351-22, 23	None	1358-104, 115
122"	1318-103	1311-102	1318-103
134 & 158"	1358-4, 31	1351-110, 111	1358-104, 115
194"	1358-5, 32	1351-110, 111	1358-105, 116

Coupling Shaft (Center) Bearing:—A new type cushion mounted Coupling Shaft Ball Bearing bolted to underside of intermediate frame cross member is now used. Bearing is mounted on end of coupling shaft in a sleeve with a felt retainer sleeve on each end and a bearing baffle over the front end. Bearing is retained by center universal companion flange. Bearing and sleeve assembly mounted in center support which is bolted to underside of frame cross member.

REAR AXLE (STD.):—Own Make. Full floating, Spiral Bevel gear type with straddle-mounted pinion and Hotchkiss Drive.
For complete data, refer to 1941 Mech. Equip. Index.

Ratio	Standard	Optional
¾ & 1 Ton (4 Cyl.)	6.67-1	
¾ & 1 Ton (85 V8)	4.857-1	4.11-1
All Others	6.67-1	5.14-1, 5.83-1

Backlash—.004-.016".

Removal:—Split rear universal joint by taking out two 'U' bolts and nuts. Lower propeller shaft. Disconnect hand brake cables at equalizer (¾ & 1 Tonner) and flexible hydraulic brake line at rear axle (bleed lines when re-connected). Disconnect rear springs (semi-elliptic type) and withdraw axle assembly from beneath truck.

Axle Shaft Removal—Take out two screws (except ¾ & 1 Tonner) and remove hub cap, remove nuts on 8 hub studs which hold axle shaft flange in place, turn the two special screws (in tapped holes in flange) up evenly to break flange loose from wheel hub, **back these screws out,** strike axle shaft flange at center to loosen centering cones on studs, remove cones, pull axle shaft out (wheel not disturbed).

Wheel Bearing Adjustment—Remove axle shaft (above), use special bearing adjusting wrench and remove bearing locknut (outer nut), nut retainer, and grease retainer (except ¾ & 1 Tonner). Adjust inner bearing adjusting nut by turning up until tight and then backing off ⅛ turn, install grease retainer, bearing nut retainer, outer bearing locknut, turn locknut up tight.

NOTE—When installing axle shaft, make certain that gasket in place under shaft flange, cones in place on studs and that two loosening screws backed off sufficiently so that stud nuts can be tightened securely. Turn the two loosening screws in just enough to prevent loosening in service.

REAR AXLE (OPTL.):—Own Make. Two-speed type.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—5.83-1 (Direct), 8.11-1 (2nd speed).
Backlash—.006-.020".

Removal:—Same as for standard axle (above) except that control linkage must also be disconnected.

SHOCK ABSORBERS:—Houde (Houdaille). Model BB-CME (front), BBG (rear). Double acting, adjustable, hydraulic type.
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—Steering Gear—Gemmer Model 335 Worm-and-Roller type with 'Push-Pull' adjustment.
For complete data, refer to 1941 Mech. Equip. Index.

Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and new semi-elliptic springs.

Kingpin Inclination—7° crosswise.

Caster—3½° Max., 1° Min. Must be equal within ½°.

NOTE—Caster angle controlled by wedge shims inserted between axle pads and springs. To increase caster, insert taper wedge shims equally at both sides (make certain that spring tie bolt passes through hole in wedge so that wedge held securely in place with spring leaves).

Camber—1° Max., ¼° Min. Must be equal within ¼° and right wheel must not exceed left wheel. NOTE—Axle may be bent cold to correct Camber provided that proper tools (wedges and blocks to prevent crushing axle flange) used.

Toe In—1/16". Set at 1-10 ratio to Camber. Toe-in increases with load on trucks and should be set with truck empty. Adjust by loosening clamp bolts and turning tie rod.

Steering Geometry (Toe out on Turns)—Outer wheel turned 20°. Inner wheel 23° (¾ & 1 Tonner), 23¾° (101" WB.), 22⅔° (134" WB.), 22¼° (158" WB.). Allowable variation ½°.

BRAKES:—Service. Lockheed, hydraulic, double anchor type. Hand lever applies rear wheel service brakes (¾ & 1 Ton), independent shaft brake (all others).
For complete data, refer to 1941 Mech. Equip. Index.

Drums—Cast-iron. Diameter: ¾ Ton (12" front & rear). 1 Ton (12" front, 14" rear). Other Trucks (14" front, 15" rear).

Wheel Cylinders—Stepped type used on ¾ Ton (front & rear wheels), 1 Ton (front). Sizes as follows:

	Front Wheel Front Rear	Rear Wheel Front Rear
¾ Ton	1.25"-1.00"	1.25"-1.00"
1 Ton	1.25"-1.00"	1.375"-1.375"
All Others	1.375"-1.375"	1.50"-1.50"

Lining—Forward shoes (Woven—all wheels ¾ Ton, front wheel 1 Ton. Molded—All Others). Rear shoes (Molded—All Models).

	Width	Thickness	Length per Shoe Forward	Rear
¾ Ton (all)	1.75"	.20"	13.18"	10.1"
1 Ton (front)	1.75"	.20"	13.18"	10.1"
1 Ton (rear)	2.00"	.268"	15.53"	10.75"
Others (front)	2.00"	.268"	15.53"	10.75"
Others (rear)	3.50"	.33"	16.64"	11.52"

Clearance—Least possible amount without drag.

Hand Brake (¾ & 1 Ton):—See Service Brakes above.

Hand Brake (Others):—On drum at rear of transmission.

Adjustment—Fully release hand brake lever. Flat on cam should rest on ear of band (if not, remove pin in lower end of hand lever). Turn anchor screw (on left side) in to give .010" clearance between drum and band, replace locking wire. Loosen lock nut and turn bracket adjusting screw (on right side) to give .010" clearance for lower half of band, tighten lock nut. Tighten adjusting rod nut (on right side), to give .010" clearance for upper half of band (slotted side of nut up). Adjust brake rod clevis so that pin enters clevis and hand brake lever with flat of cam on ear of band and lever in fully released position.

Drum Diameter—7.81".

Lining—Woven. Width 2.5". Thickness 0.250".

ENGINE HOOD NOTE:—Hood is Alligator type with latch at forward end. To raise hood, press toward left on hood latch handle in lower left front hood louvre, raise hood slightly, reach under lower edge of hood and release safety catch, raise hood.

SERIAL NUMBER:—First No. 700001 (109 '40), 700146 (109 '41), 900001 (113 '41). Stamped on plate on floor inside right rear door.

ENGINE NUMBER:—First No. 710001 (109 '40), 710222 (109 '41), 910001 (113 '41). On plate on right side of engine block and on Serial No. Plate (above).

ENGINE SPECIFICATIONS:—Six cylinder, 'L' head. 109 engine equipped with Graham Supercharger.
Bore—3¼". **Stroke**—4⅜".
Displacement—217.8 cu. ins.
Rated Horsepower—25.35 AMA.
Developed Horsepower—93 at 3800 RPM (113), 120 at 4000 RPM (Supercharged 109).
Compression Ratio—6.65-.1 Std. 7.0-1 & 7.25-1 Optl.
Compression Pressure—125 lbs. (113), 130 lbs. (109) at cranking speed for Std. 6.65-1 Head.
Vacuum Reading—17" idling at 7-8 MPH.

PISTONS:—Bohn autothermic, aluminum alloy, cam ground, plated type with special cylinder wall lubrication system. *See 1938 Graham Shop Notes.*
Weight—14⅛ ozs. (stripped). **Length**—3⅝".
Removal—Pistons and rods removed from above.
Clearance—Top .024". Skirt .0025".
Replacement Pistons:—Finished pistons (with pins fitted) furnished in oversizes of 3.247" to 3.252" (in .001" steps), 3.252" to 3.274" (in .002" steps) and 3.277". NOTE—Piston size stamped on head.
Fitting New Pistons:—Use .0025" feeler ½" wide inserted between piston and cylinder wall at right angles to pin. Pull required to withdraw feeler must be 10-15 lbs. at all points in cylinder.
Installing Pistons:—Install pistons with four vertical grooves on skirt toward camshaft (right side).

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin.

Ring	Width	End Gap	Side Clearance
Compr.	3/32"	.007-.015"	.0015" Min.
Oil Cont.	5/32"	.007-.015"	.0015" Min.

Replacement Rings & Installation Directions:—*See Graham 1938 Shop Notes for data.*

PISTON PIN:—**Diameter** 13/16". **Length** 2 13/16". Pin locked in rod by clampscrew.
Pin Fit in Piston—.0005" clearance (hand push fit).
Replacement Pins:—Furnished Std. and .002", .005", .010" oversize (new pistons have fitted pins).

CONNECTING ROD:—**Length** 7". Bearing caps dowelled on rods and held by capscrews in blind tapped holes.
Crankpin Journal Diameters—2 1/16".
Lower Bearing—Removable steel-backed, cadmium-silver-lined type (not grooved, no oil spray hole).
Clearance—.0008-.0021". **Sideplay**—.004-.006".
Bearing Adjustment:—None (no shims). Replace bearings. New bearings should be tight with .002" feeler 1" long installed under cap (cap can be sanded on face plate to secure this fit). Install new bearings with tang engaging groove in rod and cap.
Installing Rods:—Lower Bearings offset. Install rod with widest half of bearing toward rear (#1, 3, 5), toward front (#2, 4, 6). Head of piston pin clampscrew should be toward camshaft on all rods.

CRANKSHAFT:—4 bearing, integral counterweights with Lanchester type Vibration dampener.
Journal Diameters—2⅜" all bearings.
Bearing Type (Front)—Cadmium-silver lined bushing inserted in hole in crankcase from forward end with bushing flange doweled to crankcase.
Bearing Type (Others)—Conventional removable steel-backed, cadmium-silver lined type.
Clearance (All Bearings)—.002".
Bearing Adjustment & Replacement:—*See Graham 1938 Shop Notes for Crankshaft bearing data.*
End Thrust:—Taken by front bearing. Adjusted by adding or removing shims furnished .002", .008" thick. **Endplay**—.004-.006".

CAMSHAFT:—4 Bearing. Non-adjustable Chain Drive. **Journal Diameters**—#1, 1⅞"; #2, 1 13/16"; #3, 1¾"; #4, 1¼". **Bearing Type**—Bronze bushings.
End Thrust:—Taken by spring-loaded plunger in forward end of camshaft.
Timing Chain:—Link-Belt No. 336. Width 1". Pitch .500". Length 23" or 46 links.
Camshaft Setting:—Sprockets are marked. With #1 and #6 pistons on top dead center and marks on both sprockets on upper left side, mesh chain so there are exactly 9 links or 10 pins (inclusive of pins meshed opposite marks) between marks.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 33/64"	.341"	4 61/64"
Exhaust	1 21/64"	.341"	4 61/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	5/16"	.002-.003"
Exhaust	45°	5/16"	.002-.003"

Tappet Clearance:—.010" all valves, engine hot.
Valve Guides:—Pressed in block. Ream after installation for correct clearance.
Valve Springs:—Spring free length 2".

	Spring Pressure	Length
Valve Closed	44 lbs.	1 21/32"
Valve Open	98 lbs.	1 11/32"

Valve Lifters:—Cylindrical type. Diameter 1". Operate in guide holes 1 21/32" long finished in block.
Lifter Clearance in Guide—.0005-.0015".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 4½° BTDC. Close 47½° ALDC.
Exhaust Valves—Open 47½°BLDC. Close 4½°ATDC.
To Check Valve Timing—Set tappet clearance #6 exhaust valve at .012". This valve should close with piston 4½° or .0088" past top dead center when flywheel mark 'EC-1' lines up with indicator under cover on right front face of flywheel housing. Reset tappet clearance at .010" hot.

SUPERCHARGER (109):—Own make, centrifugal type. Carburetor mounted directly on top of supercharger case (Supercharger blower between carburetor and manifold).
For complete data, refer to 1941 Mech. Equip. Index.
Supercharger Removal & Drive Data:—*See Graham 1938 Shop Notes for complete instructions.*

LUBRICATION:—Pressure system. Gear type oil pump located in crankcase.
Normal Oil Pressure:—45 lbs. at 30 M.P.H.
Oil Pressure Regulator:—Located on right side of crankcase at rear of engine number plate. Opens at 50 lbs. Adjusted by adding or removing washers between spring and plunger.
Oil Pressure Gauge:—Stewart (Stewart-Warner) electric.
For complete data, refer to 1941 Mech. Equip. Index.
Crankcase Capacity—5 quarts (refill).

COOLING SYSTEM:—**Capacity**—16 quarts.
Water Pump:—Packless type. Sealed ballbearing shaft.
For complete data, refer to 1941 Mech. Equip. Index.
Removal—Remove fan belt and pump mounting bolts, remove fan and pump as an assembly.
Thermostat:—Detroit Lubricator. In cyl. head outlet.
Setting—Starts to open 150°F. Fully open at 180°.

CLUTCH:—**Long Model 9½CF-CS.** Semi-centrifugal, single plate, dry disc type.
For complete data, refer to 1941 Mech. Equip. Index.
Facings—Chevron or Spiral wound Moulded type, 2 required. I.D. 6". O.D. 9½". Thickness .125".
Adjustment—Free movement of clutch pedal must be about 1¼". To adjust, loosen lock nut above pivot block at pedal, turn adjusting nut below pivot block on connector rod until proper clearance obtained.
Removal:—Remove Transmission (See Transmission below), take off clutch housing underpan, take out clutch mounting screws in cover flange (turning all screws out evenly, remove clutch from below.

TRANSMISSION:—**Warner.** Constant-mesh, synchromesh, (Second & High), sliding gear (Low & Reverse), all helical gear type.
For complete data, refer to 1941 Mech. Equip. Index.
Transmission Control:—Own remote control type mounted on steering column.
For complete data, refer to 1941 Mech. Equip. Index.
Removal:—Disconnect hand brake and clutch linkage, disconnect propeller shaft at front universal, support engine at rear, remove rear engine mounting cross-member, disconnect transmission shift linkage. Take out transmission mounting bolts, pull transmission straight back and remove.

UNIVERSAL JOINTS:—**Spicer 1271-101 (Frt.), 1278-101 (Rear).** Needle bearing type.
For complete data, refer to 1941 Mech. Equip. Index.

REAR AXLE:—**Spicer Model 41-3.** Semi-floating, hypoid gear type with Hotchkiss drive.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—4.09-1 Std., 4.55-1 Optl.
Backlash—.004-.008". Shim adjustment.
Removal:—Disconnect shock absorbers, brake line and hand brake linkage. Hoist rear end of car, disconnect propeller shaft at rear universal. Remove rear spring U-bolts, disconnect spring shackles, withdraw axle assembly from under car.
Wheel Bearing Adjustment:—Shims provided between flanged end of axle housing and backing plate. To adjust, remove wheel, hub, and drum assembly, remove shims to decrease endplay. **Endplay**—.002-.007".

SHOCK ABSORBERS:—**Delco.** Direct acting, hydraulic type.
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—**Steering Gear**—Gemmer Model 305 Worm-and-Roller type with 'push-pull' adjustments.
For complete data, refer to 1941 Mech. Equip. Index.
Front Suspension:—Spicer, conventional 'I' beam section front axle with Reverse-Elliott ends and semi-elliptic springs.
Kingpin Inclination—7½° crosswise.
Caster—3½°. Adjust by inserting wedge shims between spring and spring pad on axle.
Camber—1°. No adjustment.
Toe In—⅛". Adjust in usual manner by loosening clamp bolts and turning tie rod to change length.

BRAKES:—**Service**—Lockheed hydraulic type. Hand lever applies rear wheel service brakes.
For complete data, refer to 1941 Mech. Equip. Index.
Drums—10". Cast iron type.
Lining—Moulded type. Width 2". Thickness ¼". Length
Clearance—.006" heel, .010" toe for each shoe.
Hand Brake:—See Service Brakes above.
NoRol:—Optional equipment on all cars.
For complete data, refer to 1941 Mech. Equip. Index.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

ENGINE HOOD (BONNET) LOCK:—Alligator type hood (hinged at front) with integral side panels and instrument panel lock. To raise hood, push forward on lock handle located under edge of instrument panel to left of steering column, lift rear of hood.

Hood (Bonnet) Removal—Unlock and raise hood. Disconnect bonnet light wires from terminals on fender junction block. Remove bonnet-to-bonnet support bolts and bonnet-to-bonnet hinge bolts. Lift bonnet straight up and remove from car. Align Hood and Front Fenders as directed below when installing Bonnet.

Radiator Louvre Panel Removal—Remove panel-to-fender bolts from under fender. Remove front bumper bolt and and loosen rear bolt permitting bumper assembly to be lowered. Remove center front screw from under panel and lift panel off.

HOOD (BONNET) AND FRONT FENDER ALIGNMENT:—U-shaped bonnet hinge consisting of cross-bar in back of grille with an upright arm at each end which attach to each side of hood. Hinge cross-bar equipped with loose fitting bracket at each end which is attached to frame bracket by screws. Frame and hood hinge brackets have serrated faces. Thick and thin hinge positioning washers assembled on each end of hinge cross-bar and are retained by a large cotter pin. Each front fender positioned by brace rod anchored to frame at lower end and to fender bracket on upper end by means of positioning nuts.

Hood (Bonnet) Adjustments—Bonnet alignment can be adjusted at three points as follows: For full fore-and-aft bonnet movement, loosen bonnet-to-bonnet hinge bolts (three on each side along lower edge of hood). For slight sidewise or lengthwise movement, loosen bonnet hinge frame bracket-to-frame bolts. To position bonnet hinge assembly for sidewise movement, take out large cotter pin in each end of hinge cross-bar and add or remove washers for correct fit.

Fender Adjustment—Fender fit can be adjusted by means of positioning nut on each side of fender bracket at upper end of brace rod. Separate brace rod for each fender located under bonnet behind radiator louvre panel.

Radiator Louvre Panel Adjustment—Louvre panel fit can be adjusted by loosening louvre-to-fender bolts on outer ends of panel. Bolts on back side of panel and are accessible from behind panel with bonnet raised. Louvre panel should be pushed forward as far as possible for correct fit.

FRONT FENDER REMOVAL:—Unlock and raise hood. Disconnect headlamp wires at junction block, unclip wires from fender and dash and push headlamp cables through hole in fender (remove battery if left fender to be removed). Remove fender bolts at following points: running board, brace rod top nut, louvre panel, fender cross member (with spacers), brace to cross member screw, core baffle to fender screws (right fender only), radiator lower tank shield screws, hood support screws, apron support to inspection cover screw, and horn bracket to frame screws. Lift fender off.

Right Front Fender Inspection Hole Plate Removal (for access to valve compartment)—Removable plate used in right front fender for access to valve chamber, fuel pump, and oil pump. To remove plate, unlock and raise hood, remove horn mounting bolts and push horns forward (in engine compartment). Raise front end of car, remove right front wheel and 12 cap screws along the top, bottom and front edge of plate (under fender).

ENGINE ASSEMBLY REMOVAL:—All engines can be removed as follows: Remove bonnet (see Hood Removal), front seat cushion, accelerator pedal, front floor mat, transmission hole cover, clutch housing to engine bolts, engine ground strap, radiator core (see Radiator Core Removal), radiator stay rods and horns. Disconnect generator, starter, temperature gauge, and oil check valve wires and remove wiring harness from clips on left side of engine. Disconnect flexible fuel pump feed line and remove fuel line to carburetor. Disconnect throttle linkage leading from accelerator cross shaft and remove cross shaft (pull shaft toward spring and slip shaft out of opposite bracket). Disconnect windshield wiper hose at manifold. Remove spark plug wires and bracket, distributor cap, carburetor and air cleaner. Disconnect exhaust pipe at manifold. Remove front engine support bolts and nuts. Hoist engine out of car (use Tool J-917 attached to engine) move engine forward carefully to disconnect from transmission mainshaft. With engine out of car, remove distributor, generator, fuel pump and clutch.

Installation—Reverse procedure listed above and properly position leather seal on clutch throwout bearing as follows: Wrap a piece of soft wire around leather seal with ends of wire extending up through clutch housing opening, lower engine into place using care not to damage clutch driving plate assembly when engaging transmission mainshaft, pull wire wrapped around seal out (with seal wired in this manner, edge will not curl over when engine installed).

ENGINE FRONT SUPPORT REMOVAL:—Drain cooling system. Remove generator, fan belt, radiator outlet hose and raise front end of car. Remove radiator lower tank shield, vibration dampener (see Vibration Dampener Removal) and timing gears (see Timing Gear Removal). Block up front end of engine and remove front engine mounting bolts and nuts. Take out engine support bolt and locks and remove plate.

Installation—Reverse procedure listed above, note the following points: Clean front face of cylinder block thoroughly and use new gaskets. When replacing engine mounting bolts, tighten nuts until upper and lower plates are against spacer.

ORIGINAL BORE SIZE:—Original production (new engine) bore size indicated by code mark stamped on lower edge of valve chamber opposite cylinders. See table below for size and code marks.

Code Mark	Cylinder Diameter	Code Mark	Cylinder Diameter
A	3.000"	AO	3.010"
B	3.0005"	BO	3.0105"
C	3.001"	CO	3.011"
D	3.0015"	DO	3.0115"
E	3.002"	EO	3.012"

Note—Recondition cylinders to size for which replacement pistons and rings available (see below).

Original Piston Size—Sizes and markings for original pistons same as for Replacement Pistons. See Replacement Piston Table and Piston Markings following.

REPLACEMENT PISTONS:—Standard and oversize pistons marked by letter stamped on head and furnished for **cylinder diameter sizes** listed below. See Replacement Rings (following) for ring sizes.

Piston Mark	Piston Size	Cylinder Size
B	2.9985"	3.000" & 3.0005"
D	2.9995"	3.001" & 3.0015"
F	3.0005"	3.002" & 3.0025"
J	3.0025"	3.004"
L	3.0035"	3.005"
BO	3.0085"	3.010" & 3.0105"
DO	3.0095"	3.011" & 3.0115"
FO	3.0105"	3.012" & 3.0125"
LO	3.0135"	3.015"
BB	3.0185"	3.020"
DD	3.0195"	3.021"
FF	3.0205"	3.022"

Piston Markings—Code marks stamped on head of piston indicate the following: **Letter** indicates piston size and cylinder size for which piston to be fitted (see table below). **Number** indicates piston weight in ounces (if 2 numbers used, one over the other, top number indicates weight in ounces, lower number ¼ ounces). All pistons in one engine should be of same weight (carry same weight marks on head). NOTE—Original factory installed pistons carry two additional numbers, one number indicates cylinder in which piston installed, second number indicates cylinder block number.

REPLACEMENT RINGS:—Use standard or oversize rings for replacement pistons listed above. Ring size and pistons for which each ring size applies listed in table below.

Ring Size	Piston Mark	Ring Size	Piston Mark
3.000"	B, D, F	3.010"	BO, DO, FO
3.003"	J	3.015"	LO
3.005"	L	3.020"	BB, DD, FF

Note—If rings filed, keep clearance at pin uniform with end gap (.005" minimum).

Expanding Piston Ring Service Kit—Hudson Part No. 161781 Kit available for six cylinder engines with 5/32" thick lower oil ring. Kit contains one complete ring set with expanders for six cylinder For eight cylinder, use one 6 cyl. kit Part No. 161780 (for 3/16" oil ring) and obtain additional rings and expanders from second 6 cyl. kit.

PISTON PIN SERVICING:—When replacing pins car manufacturer recommends that oversize piston pins be fitted to the piston boss and new piston pin bushings be installed in rod. Piston pin bosses are diamond-bored and should not be reamed.

Replacement Piston Pins—Furnished in standard size and .002", .005", .010" oversize.

Fitting Pins—Pins should be a hand press fit in piston with piston heated to 200°F. (heat in boiling water or electric furnace—do not use torch or direct heat). Replace pin bushing in rod and ream or burnish to .0003" greater diameter than pin (giving desired .0003" clearance on pin). To check pin fit in rod bushing, hold piston with rod in horizontal position, rod should just turn on pin of own weight. CAUTION—Do not ream piston pin bosses in piston.

CRANKSHAFT SIZE CODE:—Cars equipped with .010" undersize main bearing pins and connecting rod pins identified by marks stamped on left front corner of cylinder block on bottom face beside oil reservoir gasket (visible without removing oil reservoir) as follows:

MU—.010" undersize main bearing pins.
PU—.010" undersize connecting rod pins.
PMU—.010" undersize main and connecting rod pins.
NOTE—These pins require .010" undersize bearings.

CONNECTING ROD AND MAIN BEARING PALNUTS:—Palnut (locknut or companion nut) used in place

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

of cotter pin to lock main bearing cap stud nuts and connecting rod bolt nuts. Consists of a small single thread nut stamped from light gauge steel and tempered.

Installation—After tightening main bearing cap nuts to 75 ft. lbs. tension or connecting rod bolt nuts to 40 ft. lbs. tension, intall new palnut with smooth face toward nut, spin palnut on until it touches nut finger tight, then lock in place with a wrench an additional ¼-⅓ turn. NOTE—Car manufacturer recommends that new palnuts be used whenever main bearing caps or connecting rod bearing caps installed.

VIBRATION DAMPENER REMOVAL:—Dampener can be removed from beneath car without removing radiator louvre panel or radiator (radiator must be removed on Eight only) as follows: Remove radiator louvre panel center moulding, front bumper bracket bolts permitting bumper to drop down, and fan belt. On Eight only, remove radiator (see Radiator Core removal following). Unscrew crankshaft starting jaw from end of crankshaft. Install jaw of special vibration dampener removal tool over dampener and place screw of tool through starting crank hole. Withdraw dampener by turning screw of dampener tool and remove dampener from beneath car on Six, from above on Eight.

CRANKSHAFT REMOVAL:—Crankshaft can be removed with engine in chassis as follows: Remove bonnet (see Hood (Bonnet) Removal above), radiator (see Radiator Core Removal following), vibration dampener (see Vibration Dampener Removal above), timing gears (see Timing Gear Removal following), transmission and clutch (see Hudson Six & Eight 'M' pages following). Remove flywheel, and engine oil pan and tray. Remove connecting rod bearing caps and push rods up clear of crankshaft. Remove front and rear main bearing caps with Puller Tool J-377. Remove center main bearing cap with care which will allow crankshaft to be lowered out of engine.

Installation—Reverse removal procedure listed above. Install new oil seals at front and rear main bearing cap (see Front and Rear Main Bearing Cap Installation following) and new palnuts on main and connecting rod bolts (see Connecting Rod and Main Bearing Palnut Installation above).

MAIN BEARINGS:—Removal and Installation (with engine in car). Bearing halves are retained in crankcase and caps by a machine screw in each half, requiring removal of crankshaft for access to screw in upper half. Remove crankshaft (see Crankshaft Removal above), take out machine screw in each bearing half in crankcase and caps, remove bearings. Reverse removal instructions to install bearings.

Fitting Bearings—No shims used on main bearings in the 1941 engines. To check bearing clearance, place a piece of .001" feeler stock, ½" wide and 1" long between bearing and crankshaft. Tighten bearing cap stud nuts. Bearing clearance is correct when there is a slight drag felt when turning crankshaft. If no drag felt, clearance is excessive and new factory-lined bearings furnished standard size and .010" undersize should be installed. Unfinished bearings also available, but these bearings must be line-reamed on engine. Bearing caps should not be filed to reduce bearing clearance. NOTE—Where new finished bearings installed and insufficient clearance noted, shims may be used to obtain proper clearance without scraping or reaming bearings. Normally shims will not be required.

Line-Reaming Bearings—Semi-finished bearings available for service which must be line-reamed on engine as follows: Place bearings in place in crankcase and caps with machine screws, see that ends of bearing shells are flush with crankcase and cap (if necessary dress ends of shell down), install bearing caps in place (NOTE—No shim pack used), and line-ream bearings to give .001" clearance. Thrust flange on center bearing must then be faced to give .006" endplay.

Front and Rear Main Bearing Cap Removal and Installation—These caps fit in machined openings in crankcase. Front cap has vertical and horizontal grooves, rear cap vertical grooves only, with packing installed in these grooves to seal caps in place. When removing these caps a special removing Tool J-377 must be used to pull caps out of engine. After caps removed, grooves in caps and crankcase must be cleaned of all old packing. If old packing not removed from crankcase, oil passages may be clogged. When installing main bearing caps, insert new packing in horizontal grooves in upper end of front cap first, using Crankshaft Bearing Packing Inserter Tool J-392, then install packing in vertical grooves on each side of front and rear caps (horizontal grooves not used on rear cap). Lower half of oil retainer on rear cap should be a tight fit against upper half to prevent oil leaks at this point.

CAMSHAFT CHANGE ON 3" x 4⅛" SMALL SIX CYLINDER ENGINE:—New design camshaft used on Model 10 engine after car no. 6848. Cams machined to new contour, intake and exhaust cams alike, which requires new valve timing and tappet clearance (see 1941 Hudson Six 'M' page following).

Identification—New camshaft used after car no. 6848 and may be identified by letter 'X' stamped on front face of shaft behind camshaft gear. Engines with this camshaft carry a decalcomania on valve cover stating "Tappet Clearance Hot, Inlet .010", Exhaust .012"."

Interchangeability—This new type camshaft can be installed on early 1941 engines and all 1940 engines with a bore of 3" and stroke of 4⅛" but must not be used in the 3" x 5" six cylinder engine. When this camshaft installed on engines originally equipped with old style camshaft, a decalcomania with the new tappet clearance figures of .010" Inlet and .012" Exhaust Hot, should be installed on valve cover plate.

CAMSHAFT SERVICING:—Camshaft Removal. Remove bonnet (see Hood (Bonnet) Removal above), radiator (see Radiator Core Removal following), radiator louvre panel, vibration dampener (see Vibration Dampener Removal above), fan blades, fan belt, timing gear cover and gasket, vibration dampener spacer, camshaft gear (3 bolts and lockwire), valve chamber cover, valves, tappets, oil pump, fuel pump, and distributor. Camshaft with thrust button and spring can then be withdrawn from engine by pressing down on radiator lower tank shield. NOTE—When installing camshaft, use new timing gear cover gasket and new leather oil seal (coat oil seal seat in cover with red or white lead and see that seal pressed tightly in place and not curled over when cover installed). Two special cover bolts used in lower left corner and must be installed in these holes only.

Camshaft Bearings—New thin type steel-backed, babbitt-lined bushings used (cannot be used for service on earlier cars). Factory reamed bearings available for replacement which require no reaming or scraping. Standard bearings with extra wall thickness permitting line-reaming on engine also available. These bearings should be line-reamed to give .001" bearing clearance.

Camshaft Bearing Removal & Installation—Bearings can be removed as follows: Remove camshaft (see Camshaft Removal above), remove oil pan and tray, press old bearings out. New bearings can be installed as follows: Press new bearings in place with locating notch on front edge at top (back of bearing has 1/16" chamfer so that bearings can be readily installed in crankcase, bearing material on front of bearing has light chamfer at front). Coat bearings lightly with engine oil and install camshaft as directed above.

TIMING GEAR REMOVAL:—Drain cooling system. Remove fan belt, radiator outlet hose, vibration dampener (see Vibration Dampener Removal), timing gear cover bolts, cover, cover gasket and vibration dampener spacer. Turn engine over until timing marks (2 teeth mark on camshaft gear, 1 tooth mark on crankshaft gear) coincide. Remove camshaft gear (retained by 3 capscrews and lock wire). Remove crankshaft gear using Puller Tool J-471.

Installation:—Reverse procedure listed above. Replace crankshaft gear with Tool J-483. Mesh timing gear marks as noted above.

Replacement Camshaft Gear:—A special .008" oversize camshaft gear (marked with daub of yellow paint on front face of gear) available for service. Gear backlash .002-.003" (Six), .004-.005" (Eight)

VALVE LIFTER REMOVAL:—Tappets (lifters) may be removed without removing cylinder head as follows: Remove Right Front Fender Inspection Hole Plate (see instructions under Front Fender Removal on preceding page). Remove valve chamber cover, break loose tappet adjusting screws, remove spring seat retainer using Tool J-915, remove tappet adjusting screw, spring seats, spring dampeners, tappet guide clamp screws and clamps. Take out tappet and guide assemblies.

CHECKING OILING SYSTEM:—See that oil lines securely in place and not bent or damaged. Drop oil reservoir and clean thoroughly every six months. When installing oil reservoir, check flapper valve on rear main bearing oil return tube (soldered in rear of reservoir). Valve must work freely and should be slightly open with reservoir level. Holes in gaskets between crankcase and oil dipper tray and between tray and reservoir must align with oil return tube (tube registers with hole in bearing).

OIL SUCTION PIPE SEAL:—Synthetic rubber suction pipe oil seal fitted in counter-bore in cylinder block flange at point where suction pipe passes through oil pan flange. Seal fitted around pipe and oil pan gasket widened at this point. Seal compressed by pan when pan screws tightened. NOTE—Use new seal whenever pan installed.

RADIATOR CORE REMOVAL:—Drain radiator and remove upper and lower hoses. Disconnect radiator stay rod bolt at top of radiator. Remove two radiator mounting bolts, lift core out of car.

CLUTCH OIL:—Servicing—Hudsonite (oil) in clutch must be renewed every 5000 miles. Turn engine over until hexagonal drain plug on front face of flywheel is visible in timing inspection hole on left side of motor rear support above starting motor. Remove hex head drain plug with a socket wrench, turn engine over ⅓ revolution until star on flywheel is at inspection hole, allow engine to stand in this position one minute to drain old oil, turn engine over until filler plug is again at inspection hole, insert ⅓ pint Hudsonite (use J-485 gun) replace plug. **Capacity & Oil—⅓ pt. Hudsonite Clutch Compound.**

MODEL 10 ENGINE OPTION:—This car series may be had with larger 3" x 5" six cylinder engine. See Serial Number Model 10 Note below for Serial Number Plate designation when car equipped with this engine.

ENGINE HOOD (BONNET) LOCK, HOOD REMOVAL AND ADJUSTMENT:—*See Hudson Shop Notes.*

SERIAL NUMBER:—First number 10101 (Model 10—See Note below), 11101 (Model 11 Super Six), 12101 (Model 12 Commodore Six), 18101 (Model 18 Big Boy Series). The first two figures of the car number indicates the model thus: 10101 (Model 10, Serial No. 101). Number stamped on plate attached to right front hinge pillar, visible with door open.

Model 10 Note—Number plate on this series carries additional designations as follows: 'T' for Traveler, 'D' for Deluxe, 'C' for Commercial cars.

Model 10 with 3" x 5" Engine—Cars with this engine designated by letter 'L' stamped on number plate following model letter (see Note above) as follows: 'TL' Traveler, 'DL' Deluxe, 'CL' Commercial.

ENGINE NUMBER:—Same as Serial Number (see above). Stamped on top of cylinder block on right side between #1 and #2 exhaust ports. See Model 10 Notes above.

ENGINE SPECIFICATIONS:—Models 10T, 10D, 10C. 6 cylinder, 'L' head type.

Bore—3". **Stroke**—4⅛".

Displacement—175 cubic inches.

Rated Horsepower—21.6.

Developed Horsepower—92 at 4000 RPM.

Compression Ratio—7.25-1 cast-iron head.

Compression Pressure—125 lbs. at 125 RPM (cranking speed). 90 lbs. minimum (10 lbs. max. variation).

Vacuum Reading—Steady 18-21" idling at 600 RPM.

ENGINE SPECIFICATIONS:—Models 10TL, 10DL, 10CL, 11, 12, 18. 6 cylinder, 'L' head type.

Bore—3". **Stroke**—5".

Displacement—212 cubic inches.

Rated Horsepower—21.6.

Developed Horsepower—102 at 4000 RPM (all models except Model 18), 98 at 4000 RPM (Model 18 only). NOTE—Model 18 equipped with single carburetor, other models equipped with duplex carburetor.

Compression Ratio—6.50-1 cast-iron head.

Compression Pressure—120 lbs. at 125 RPM (cranking speed). 90 lbs. minimum (10 lbs. max. variation).

Vacuum Reading—Steady 18-21" idling at 600 RPM.

See Hudson Shop Notes for Engine Removal instructions and Engine Front Support Removal and Installation.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons.

Weight—10.5 ozs. (stripped). **Length**—3 3/16".

Removal—Pistons and rods removed from above.

Clearance—Top .016". Skirt .0005-.001". See Fitting New Pistons below.

Original Bore & Piston Sizes, Replacement Pistons:—*See Hudson Shop Notes for sizes and markings.*

Fitting New Pistons:—Use .0015" feeler ½" wide inserted between piston and cylinder wall on side opposite slot at right angles to pin. Pull to withdraw feeler must be within 3-4 lbs. Use Tool J-888-A Piston Feeler Scale to measure pull.

Installing Pistons:—T-slot away from camshaft.

PISTON RINGS:—Two compression, two oil rings (one above pin, one below pin) per piston. Rings are square end type. Rings pinned to prevent rotation. Rings cut and notched to fit pin (clearance on pin equal to ring end gap).

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.009-.011"	.001"
Oil	5/32"	.009-.011"	.001"

Replacement Rings:—*See Hudson Shop Notes for data.*

PISTON PIN:—Diameter—¾". **Length**—2 7/16". Floating type. Retained by locking rings.

See Hudson Shop Notes for Pin Servicing data.

Pin Fit in Piston—.0003" clearance (hand push fit) with piston heated to 200°F.

Pin Fit in Rod Bushing—.0003" clearance.

Replacement Pins:—Standard and .002", .005", .010" oversize.

CONNECTING ROD:—Weight—30¾ ozs. (3" x 4⅛" engines), 30 ozs. (3" x 5" engines).

Length—8⅝" (3" x 4⅛" engines), 8 3/16" (3" x 5" engines).

Crankpin Journal Diameter—1 15/16".

See Crankshaft Size Code Note in Hudson Shop Notes for Original Connecting Rod Bearing sizes.

Lower Bearing—Lead alloy, spun type. Exchange rods furnished standard and .010" undersize.

Clearance—.001". **Sideplay**—.006-.010".

Bearing Adjustment:—None (no shims). Do not file rods or caps. *See Hudson Shop Notes for Palnut (rod bolt nut locknut) installation data.*

Installing Rods:—Lower end of rods offset. Install rods with widest half of bearing toward the rear (#1, 2, 4), toward front (#3, 5, 6). Oil scoop on lower end of rod toward camshaft.

CRANKSHAFT:—3 bearing, integral counterweights.

See Hudson Shop Notes for Crankshaft and Vibration Dampener Removal, Main Bearing Removal and Installation, Replacement Bearings & Line-Reaming data.

Journal Diameters—#1, 2 11/32"; #2, 2⅜"; #3, 2 13/32".

See Crankshaft Size Code Note in Hudson Shop Notes for Original Main Bearing Sizes.

Bearings—Bronze-backed, high lead babbitt lined type. NOTE—Shim pack not used. Palnuts used in place of cotter pins to lock bearing cap nuts.

Clearance—.001".

Bearing Adjustment:—None (no shims). Do not file caps. *See Hudson Shop Notes for Bearing Adjustment and Palnut (locknut) Tightening procedure.*

End Thrust:—Taken by center bearing. Replace bearing if endplay excessive. NOTE—If new unfinished bearings installed, thrust face for center bearing must be faced for proper endplay.

Endplay—.006-.012".

CAMSHAFT:—Three bearing, gear driven type with new type bearings and timing gears.

See Hudson Shop Notes for Camshaft Removal and Camshaft Bearing installation instructions.

Production Change—Models 10T, 10D, 10C—Two types of camshafts used on this engine only (3" x 4⅛").

See Hudson Shop Notes for changes and identification.

Journal Diameters—#1, 2.000"; #2, 1.968"; #3, 1.5625".

Bearings—New type steel-backed, 'Bermax' (babbitt) lined bushings (formerly solid type babbitt).

Clearance—.002-.0025".

End Thrust:—Thrust washer between camshaft flange and crankcase. Spring loaded button in camshaft hub bears against thrust plate on gear cover. NOTE—Service thrust washer available which can be split and installed without removing camshaft.

Timing Gears:—Crankshaft gear cast-iron, camshaft gear laminated fibre. Tooth shape changed to 20° pressure angle (was 14½°) to provide quieter operation and longer gear life. Gears can be identified by figure 20 stamped on front face (crankshaft gear carries additional FRONT mark to insure correct installation). Gears may be installed in sets only (not singly) on earlier car models (new type gears similar to previous type except for tooth pressure angle).

Backlash—.002-.004".

See Hudson Shop Notes for Timing Gear removal and installation instructions.

Camshaft Setting:—Mesh marked crankshaft gear tooth between two marked teeth on camshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
All valves	1⅜"	11/32"	5 11/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0025"
Exhaust	45°	11/32"	.004"

Tappet Clearance:—Two settings used. One setting for all 3" x 5" engines and early 3" x 4⅛" engines (with first type camshaft) and a second setting for later 3" x 4⅛" engines (with second type camshaft). This second setting on later 3" x 4⅛" engines carried on instruction label attached to valve cover plate.

Setting (All 3" x 5" engines and first 3" x 4⅛" engines up to Car No. 6848)—.006" Intake, .008" Exhaust with engine running and at normal operating temperature.

Setting (Later 3" x 4⅛" engines after Car No. 6848)—.010" Intake, .012" Exhaust (as indicated by label attached to valve cover plate) with engine running at normal operating temperature.

See Hudson Shop Notes for Fender Plate Removal for access to valve compartment.

Valve Guides:—Removable type. Length 2 9/16". Use Tool J-1188 to drive guide out. Install guides with Tool J-883-A with top of guide 1 1/16" below top of cylinder block. With guides installed, ream guides (Tool J-129-2) to .002" larger than valve stem to provide proper clearance.

Valve Springs:—Cadmium plated springs used with dampener installed on bottom with open side toward cylinder. Use Tool J-587-A to install spring and dampener assembly.

Spring Free Length—2 17/64".

	Spring Pressure	Spring Length
Valve Closed	40 lbs.	2"
Valve Open	80 lbs.	1 21/32"

NOTE—When springs removed, test for pressure (Tool U-15). Replace if pressure below 34 lbs. at 2".

Valve Lifters:—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for lifter removal.*

Valve Timing:—See Camshaft Setting above.

Model 10 up to Car #6848—All other Sixes

Intake Valves—Open 10°40' BTDC. Close 60° ALDC.

Exhaust Valves—Open 50° BLDC. Close 18°44' ATDC.

These figures correct with .010" tappet clearance.

Model 10 (3"x4⅛" engine) after Car #6848

Intake Valves—Open 28°30' BTDC. Close 68°30' ALDC.

Exhaust Valves—Open 52°40' BLDC. Close 32°40' ATDC. These figures correct with .010" tappet clear.

Valve Timing Check—With .010" tappet clearance #1 intake valve opens 10°40' BTDC (see Note below for later Model 10 cars) or approx. 4 teeth on flywheel before 'UDC.1-6/' mark lines up with indicator in inspection hole above starter (piston .0441" for first Model 10, .0562" for large six cylinder 3"x5" engines, before top dead center). Reset tappet clearance at .006" with engine running and at normal operating temperature.

Model 10 (after Car # 6848)—On these 3"x4⅛" engines which use the second type camshaft, intake valve opens with piston 28°30' before top dead center with tappet clearance set to .010".

LUBRICATION:—Duo-flo (pressure and positive splash) lubricating system.

Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Normal Oil Pressure—4-12 lbs. with hot oil. No gauge used (see Oil Pressure Indicator below).

Oil Check Valve:—Located on right side of crankcase at rear. Opens at 4-12 lbs. with hot oil. Operates dash signal to indicate oil flow.

Oil Pressure Indicator:—Hudson Teleflash Oil Pressure Indicator. Consists of signal light on instrument panel operated by switch mounted on oil check valve.

For complete data, refer to 1941 Elec. Equip. Index.

Checking Oiling System:—***See Hudson Shop Notes.***

Crankcase Capacity:—4½ quarts (refill), 5½ (dry). **Servicing Note**—When changing oil without removing oil pan, refill with 4½ quarts. If oil pan removed, place 1½ quarts in upper tray before oil pan installed, then 4 quarts through filler with pan in place.

COOLING SYSTEM:—**Capacity**—13 quarts.

See Hudson Shop Notes for radiator core removal.

Water Pump:—Centrifugal, belt-driven, packless type with single outlet (no by-pass). Grease fitting provided for front & rear bearing lubrication.

For complete data, refer to 1941 Mech. Equip. Index.

Thermostat:—Fulton. Choke type located in cylinder head water outlet.

Setting—Starts to open150-155°F. Fully open 185°. NOTE—Special high temperature thermostats available for use with ethylene glycol type anti-freeze. Starts to open 160-165°F. Fully open 190°F.

Temperature Gauge:—King-Seeley Electric. K-S Nos. 8310 (Dash Unit—stamped 'T'), 7000 (Eng. Unit).

For complete data, refer to 1941 Mech. Equip. Index.

NOTE—Temperature gauge inoperative with ignition 'off'. Pointer returns to 'H' (hot) position.

CLUTCH:—**Own Make.** Single plate, cork insert type operating in oil.

For complete data, refer to 1941 Mech. Equip. Index.

Driven Member—Cork insert type. Inside Diameter 5¼" (10, 10L, 11—without overdrive), 6⅜" (12, 18; and all cars with overdrive). Outside Diameter 9" (10, 10L, 11—without overdrive), 10" (12, 18; and all cars with overdrive). Facing 90 cork inserts (9" size), 108 cork inserts (10" size), cork thickness .203".

Pedal Adjustment:—Two settings used dependent on connector link position on cross shaft lever. Normal setting (with connector link in center hole on cross shaft lever) 1½" clearance between underside of toeboard and center of clutch pedal clamp bolt. Second setting (with connector link in lower hole—for lighter clutch pedal pressure) clearance increased to 2". To adjust, loosen lock nut on connector link above clevis, take out clevis pin and turn clevis in or out for correct clearance. Check Automatic Clutch Control adjustment if this equipment used.

Clutch Oil Servicing:—***See Hudson Shop Notes for data.***

Removal:—Remove transmission (see Transmission Removal following). Drain clutch oil by turning engine over until plug on flywheel is accessible through timing inspection hole in rear engine support plate above starter, remove plug, turn engine over ⅓ revolution until star on flywheel visible through timing hole (drain hole then at bottom), allow lubricant to be drained. Loosen mounting bolts in clutch cover rim to release spring tension, remove bolts and lift clutch assembly off car.

NOTE—See Installation Note following Transmission Removal for Clutch Throwout Bearing Oil Seal data.

Automatic Clutch Control:—Vacumotive type. Optl.

NOTE—Governor switch changed during production.

For complete data, refer to 1941 Mech. Equip. Index.

TRANSMISSION:—**Own Make.** New all helical gear, constant-mesh type with synchro-mesh (Second and High), sliding gears (Low & Reverse) and steering column gear shift. NOTE—External shift rail locks not used.

For complete data, refer to 1941 Mech. Equip. Index.

Overdrive:—Warner Model AS1-R9B with electrical 'kick-down' control (new type—no centrifugal clutch pawls used). Optional equipment.

NOTE—Governor switch changed during production.

For complete data, refer to 1941 Mech. Equip. Index.

Transmission Control:—Hudson 'Handy-Shift' type.

For complete data, refer to 1941 Mech. Equip. Index.

Removal:—Transmission can be removed from inside car as follows: Take off accelerator pedal by removing cotter pins in anchor bracket and bell crank link clevis pins. Move steering column rubber hole cover up out of way. Remove floor mat by taking out screws at kick pads on dash and mat trim clips. Remove front seat cushion and transmission floor opening cover (CAUTION—Accelerator pedal operating rod should be secured so as not to drop on starter switch). Disconnect front universal by taking out four nuts and lock plates on U-bolts. Release clutch pedal return spring. Remove two cross shaft bracket bolts, clutch control link clevis pin and clutch pedal assisting spring. Remove Handy Shift control tube-to-transmission shift rod cotter pin, washer and grommet; transmission outer lever nut, washer and lever. Remove two flywheel guard-to-clutch housing screws and two rear engine mounting bolts (CAUTION—Do not remove rear engine mounting-to-clutch housing bolt). Jack rear of engine up ½" off frame. Remove clutch housing to transmission bolts. Disconnect speedometer cable from transmission. Pull transmission back and lift out.

Overdrive Transmission Removal—Same as standard transmission removal (above) except that overdrive control and wiring connections must be disconnected. Special Tool J-1502-H (hoist and dolly) should be used to lift transmission and lower onto dolly. Transmission and overdrive assembly can then be rolled out from beneath car.

Installation Note—Wrap one strand of soft wire around throw-out bearing oil seal to prevent leather curling over when transmission installed (twist wire with ends extending up through clutch housing so that it will come off the seal after transmission installed).

UNIVERSAL JOINTS:—**Spicer.** Needle bearing type.

Car Model	Spicer Model No. Front	Rear
10 (no Overdrive)	1261-101	1268-101
11, 12 (no Overdrive)	1271-101	1278-101
13, 18 (no Overdrive)	1281-101	1278-101
All Models (with Overdrive)	1281-101	1278-101

For complete data, refer to 1941 Mech. Equip. Index.

REAR AXLE:—**Own Make.** Semi-floating, spiral bevel gear type with Hotchkiss drive.

For complete data, refer to 1941 Mech. Equip. Index.

Ratio—without Overdrive: 4 5/9-1 Std. 10T, 10P, 10C, 18C; Optl. 11, 12, 18P. 4 1/9-1 Std. 11, 12, 18P; Optl. 10T, 10P, 10C. 4 7/8-1 Optl. 10T, 10P, 10C. **With Overdrive:** 4 7/8-1 Std. 10T, 10P, 10C, 18C. 4 5/9-1 Std. 11, 12, 18P; Optl. 10T, 10P, 10C, 18C. 4 1/9-1 Optl. 10T, 10P, 10C, 11, 12, 18P.

Backlash—.0005-.0035". Screw adjustment.

Removal:—Disconnect rear universal by taking out four nuts and lock plates on U-bolts, drop rear end of propeller shaft. Remove axle shafts (see instructions below). Remove bolts nuts on carrier flange, pull carrier assembly out of axle housing.

Axle Shaft Removal:—Hoist rear of car. Remove rear wheels. Remove axle shaft nut and washer (use Tool J-351). Remove hub and drum assembly using screw type wheel puller (Tool J-736—CAUTION—Car manufacturer recommends that screw type puller be used, if knock out type puller is used serious damage to differential parts may result). Remove 4 nuts on bearing cap bolts, push bolts out of backing plate, remove bearing cap and shims (without disturbing hand brake link). Take out rear wheel bearing and axle shaft using puller Tool J-352. Do not drag axle shaft on oil seal assembly in housing.

Wheel Bearing Adjustment:—Controlled by shims under bearing cap. To adjust, remove bearing cap (see directions above under Axle Shaft Removal), add or remove shims equally at both wheels (necessary to keep thrust spacer centered on differential pinion shaft—if adjustment made at one wheel only spacer will bind on shaft.

Endplay—.002-.004".

SHOCK ABSORBERS:—Direct acting, hydraulic types.

Car Model Sedans, Club Coupe:	Make	Front	Rear
10, 11, 18 (std. springs)	Monroe	160101	160107
10, 11, 18 (hvy. springs)	Monroe	161636	160108
12	Delco	1007-C	1008-S
Coupe (3 & 4 passenger): All	Monroe	161657	161658

For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—**Steering Gear**—Gemmer Model 305 Worm-and-Roller type with 'push-pull' adjustment and Center Point Steering linkage.

For complete data, refer to 1941 Mech. Equip. Index.

Front Suspension:—Independent, linked parallelogram type with coil springs and Autopoise Control.

For complete data, refer to 1941 Mech. Equip. Index.

Kingpin Inclination—4°36' crosswise.

Caster—0° (Neg. ¼° to Pos. ¼°). Adjustable.

Camber—Positive ¼° to Positive ¾°. Adjustable.

Toe In—0-1/16". Center steering arm on frame must be at center of car. To adjust, loosen clamps at ends of each tie rod and adjust tubes equally (to increase toe-in turn rods in direction of wheel travel, to decrease, turn in opposite direction).

Steering Geometry (Toe-out on Turns)—With outer wheel turned 30°, inner wheel turn should be 25°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Mechanical follow-up (pedal linked to rear wheel brakes through hand brake cables) provided. Hand lever applies rear wheel service brakes.

For complete data, refer to 1941 Mech. Equip. Index.

Drums—New centrifuse type. Diameter 10".

Lining—Multibestos molded (primary), Ferodo woven (secondary). Width 1¾". Thickness 7/32". Length per wheel 22⅛".

Clearance—.015" at each end of secondary shoe with primary shoe forced out against drum.

Hand Brake:—See Service Brakes above.

ENGINE HOOD (BONNET) LOCK, HOOD REMOVAL AND ADJUSTMENT:—*See Hudson Shop Notes.*

SERIAL NUMBER:—1st number 14101 (14), 15101 (15), 17101 (17). On right front door hinge pillar post. First 2 figures of car number indicates model.

ENGINE NUMBER:—Same as Serial No. On top of cylinder block between #1 and #2 exhaust flanges.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head type.
Bore—3". **Stroke**—4½".
Displacement—254 cubic inches. **Rated HP.**—28.8.
Compression Ratio—6.50-1 cast-iron head.
Compression Pressure—120 lbs. at 125 RPM.
Vacuum Reading—Steady 18-21" idling at 600 RPM.
See Hudson Shop Notes for Engine Removal data.

PISTONS:—Own Lo-Ex aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons.
Weight—10.5 ozs. (stripped). **Length**—3 3/16".
Removal—Piston and rod assemblies may be removed from above or below.
Clearance—Top .016". Skirt .0005-.001".
Original Bore & Piston Sizes, Replacement Pistons:—*See Hudson Shop Notes for sizes and markings.*
Fitting New Pistons:—Use .0015" feeler ½" wide (Piston Feeler Scale Tool J-888-A) inserted between piston and cylinder wall on side opposite slot 90° from pin. Pull to withdraw feeler 3-4 lbs.
Installing Pistons:—'T' slot away from camshaft.

PISTON RINGS:—2 compression, 2 oil rings (1 above pin, 1 below pin). Rings positioned by pin in groove.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.009-.011"	.001"
Oil Cont. (#1)	3/16"	.009-.011"	.001"
Oil Cont. (#2)	5/32"	.009-.011"	.001"

Replacement Rings:—*See Hudson Shop Notes for data.*

PISTON PIN:—**Diameter**—¾". **Length**—2 7/16". Floating type. Retained by locking rings.
See Hudson Shop Notes for Pin Servicing data.
Pin Fit in Piston—.0003" clearance (hand push fit) with piston heated to 200°F.
Pin Fit in Rod Bushing—.0003" clearance.
Replacement Pins:—Std., .002", .005", .010" oversize.

CONNECTING ROD:—**Weight** 30 ozs. **Length** 8 3/16".
Crankpin Journal Diameter—1 15/16". *See Crankshaft Size Code Note in Hudson Shop Notes for original bearing size.*
Lower Bearing—Lead alloy, spun type. Exchange rods furnished standard and .010" undersize.
Clearance—.001". **Sideplay**—.006-.010".
Bearing Adjustment:—None (no shims). Replace rods.
See Hudson Shop Notes for Palnut (locknut) data.
Installing Rods:—Offset. Install rods with widest half of bearing toward rear (#1, 3, 5, 7), toward front (#2, 4, 6, 8). Oil scoop on all rods toward camshaft.

CRANKSHAFT:—5 bearing, integral counterweights.
See Hudson Shop Notes for Crankshaft and Vibration Dampener Removal, Main Bearing Removal and Installation, Replacement Bearings & Line-Reaming data.
Journal Diameters—#1, 2 9/32"; #2, 2 5/16"; #3, 2 11/32"; #4, 2⅜"; #5, 2 13/32". *See Crankshaft Size Code in Hudson Shop Notes for original bearing sizes.*
Bearings—Bronze-backed, high lead babbitt lined type. NOTE—Shim pack not used. Palnuts used in place of cotter pins to lock bearing cap nuts.
Clearance—.001".
Bearing Adjustment:—None (no shims). Do not file caps. *See Hudson Shop Notes for Bearing Adjustment and Palnut (locknut) tightening procedure.*
End Thrust:—Taken by center bearing. Replace bearing if endplay excessive. **Endplay**—.006-.012".

CAMSHAFT:—Five bearing, gear driven type with new type bearings and timing gears. *See Hudson Shop Notes for Camshaft Removal and Bearing Installation.*
Journal Diameters—#1, 2.029"; #2, 1.998"; #3, 1.966"; #4, 1.935"; #5, 1.498".
Bearings—New type steel-backed, 'Bermax' (babbitt) lined bushings (formerly solid type babbitt).
Clearance—.002-.0025".
End Thrust:—Thrust washer between camshaft flange and crankcase. Spring loaded button in camshaft hub bears against thrust plate on gear cover. NOTE—Service thrust washer available which can be split and installed without removing camshaft.
Timing Gears:—New type. All data same as for 1941 Hudson Six. *See 1941 Hudson Six, Models 10, 11, 12, 18 'M' article (preceding pages) for data.*
Camshaft Setting:—Mesh marked crankshaft gear tooth between two marked teeth on camshaft gear.

VALVES:

	Head Diameter	Stem Diameter	Length
Intake	1½"	11/32"	5 3/32"
Exhaust	1⅜"	11/32"	5 3/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	11/32"	.0025"
Exhaust	45°	11/32"	.004"

Tappet Clearance:—.006" Int., .008" Exh., hot & idling.
See Hudson Shop Notes for Fender Plate Removal.
Valve Guides:—Removable type. Length 2 9/16". Use Tool J-1188 to drive out guides. Install guides with Tool J-883-A with top of guide 15/16" below top of block. After installing, ream guides (Tool J-129-2) .002" larger than valve stem for stem clearance.
Valve Springs:—Cadmium plated springs used with dampener installed on bottom with open side toward cylinder. Use Tool J-587-A to install spring and dampener assembly. **Spring Free Length**—2 17/64".

	Spring Pressure	Spring Length
Valve Closed	40 lbs.	2"
Valve Open	80 lbs.	1 21/32"

NOTE—Replace if pressure below 34 lbs. at 2".
Valve Lifters:—Roller shoe type, fitted in removable guides. *See Hudson Shop Notes for lifter removal.*
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 10°40' BTDC. Close 60° ALDC.
Exhaust Valves—Open 50° BLDC. Close 18°44'ATDC.
Above figures correct with .010" tappet clearance.
Valve Timing Check—With .010" tappet clearance #1 intake valve should open with piston 10°40' or .0494" BTDC when a point on the flywheel approximately 3.97 teeth before 'UDC.1-8/' mark lines up with indicator in inspection hole above starter. Reset tappet clearance at .006" hot and idling.

LUBRICATION:—Duo-flo (pressure & positive splash).
Oil Pump:—Oscillating plunger type, gear driven by camshaft. Mounted on right side of crankcase.
Normal Oil Pressure—4-12 lbs. with hot oil. No gauge used (see Oil Pressure Indicator below).
Oil Check Valve:—Located on right side of crankcase at rear. Opens at 4-12 lbs. with hot oil. Operates dash signal to indicate oil flow.
Oil Pressure Indicator:—Hudson Teleflash Oil Pressure Indicator. *For data, refer to Elec. Equip. Index.*
Checking Oiling System:—*See Hudson Shop Notes.*
Crankcase Capacity:—7 qts. (refill), 9 qts. (dry).
Servicing Note—Whenever pan removed, install 2 qts. add'tl. oil in upper tray before installing oil pan.

COOLING SYSTEM:—**Capacity**—18 quarts.
See Hudson Shop Notes for radiator core removal.
Water Pump:—Centrifugal, belt-driven, packless type with double outlet (15,17—with by-pass), single outlet (14—no by-pass used).
For complete data, refer to 1941 Mech. Equip. Index.
Thermostat:—Fulton. By-pass type (15, 17), choke type (14), in cylinder head water outlet.
Setting—Starts to open 150-155°F. Fully open 185°F.
NOTE—Special high temperature thermostats available for use with ethylene glycol type anti-freeze. Starts to open 165-170°F (15, 17), 160-165°F (14). Fully open 195°F. (15,17), 190°F. (14).
Temperature Gauge:—King-Seeley Electric. K-S Nos. 8310 (Dash Unit—stamped "T"), 7000 (Eng. Unit).
For complete data, refer to 1941 Mech. Equip. Index.
NOTE—Gauge reads HOT with ignition 'off'.

CLUTCH:—**Own Make.** Single plate, cork insert type operating in oil.
For complete data, refer to 1941 Mech. Equip. Index.
Driven Member—Cork insert type. Inside Diam. 6⅜". Outside Diam. 10". Facing 108 corks .203" thick.
Pedal Adjustment & Clutch Removal:—*See 1941 Hudson Six (preceding 'M' page) for complete data.*
Clutch Oil Servicing:—*See Hudson Shop Notes for data.*
Automatic Clutch Control:—Vacumotive type Optl.
NOTE—Governor switch changed during production.
For complete data, refer to 1941 Mech. Equip. Index.

TRANSMISSION:—**Own Make.** New all helical gear, constant-mesh type with synchro-mesh (Second & High), sliding gears (Low & Reverse) and steering column gear shift. NOTE—External shift rail locks not used. *For data, refer to Mech. Equip. Index.*
Overdrive:—Warner Model AS1-R9B with electrical 'kick-down' control (new type—no centrifugal clutch pawls used). Optional equipment.
NOTE—Governor switch changed during production.
For complete data, refer to 1941 Mech. Equip. Index.
Transmission Control:—Hudson 'Handy-Shift' type.
For complete data, refer to 1941 Mech. Equip. Index.
Removal:—*See 1941 Hudson Six (preceding 'M' page).*

UNIVERSAL JOINTS:—**Spicer**—Front—1271-101 (except 17 without Overdrive). 1281-101 (17 Standard). Rear—1278-101 (all models). Needle bearing types.
For complete data, refer to 1941 Mech. Equip. Index.

REAR AXLE:—**Own Make.** Semi-floating, spiral bevel gear type with Hotchkiss drive.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—4 1/9-1 (Standard, Optl. on Overdrive), 4 5/9-1 (Std. with Ovdr., Optl. on reg. transmission).
Backlash—.0005-.0035". Screw adjustment.
Removal, Axle Shaft Removal and Wheel Bearing Adjustment:—*See 1941 Hudson Six (preceding page)*

SHOCK ABSORBERS:—**Delco**—Sedans & Club Coupes: 1007-C (front), 1008-S (rear). **Monroe**—3 & 4 passenger coupes: 161657 (front), 161658 (rear). Direct acting, hydraulic types.
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—**Steering Gear**—Gemmer Model 335. Worm-and-Roller type with 'push-pull' adjustment and Center Point Steering linkage.
For complete data, refer to 1941 Mech. Equip. Index.
Front Suspension:—Independent, linked parallelogram type with coil springs and Autopoise Control.
For complete data, refer to 1941 Mech. Equip. Index.
Kingpin Inclination—4°36' crosswise.
Caster—0° (Neg. ¼° to Pos. ¼°). Adjustable.
Camber—Positive ¼° to Positive ¾°. Adjustable
Toe In—0-1/16". Loosen clamps at ends of each tie rod (adjust rods equally with steering arm centered).
Steering Geometry—Inner wheel 25°, Outer 30°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Mechanical follow-up (pedal linked to hand brake cables) provided. Hand lever applies rear service brakes.
For complete data, refer to 1941 Mech. Equip. Index.
Drums—Centrifuse. Diameter 11".
Lining—Multibestos molded (primary), Ferodo woven (secondary). Width 1¾". Thickness 7/32". Length per wheel 23 15/16".
Clearance—.015" at both ends of secondary (rear) shoe with primary shoe forced out against drum.
Hand Brake:—See Service Brakes above.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

OIL PAN REMOVAL:—To remove oil pan, disconnect radius rods at rear end, push rods down and block in this position (install block between ball connection at rear end and frame cross-member). Attach hoist to front bumper bars and raise front end of car (not front axle). Remove starter motor. Take out oil pan screws and remove pan. NOTE—Pan removal will be facilitated by disconnecting exhaust pipe, steering drag link, and tie rod.

RECONDITIONED ENGINES & CYLINDER BLOCKS:

Engines—Reconditioned engines (with Heads and Oil Pan) furnished in one size only as follows:

Model	Part No.
Zephyr 16H	06H-6012-A
Continental 16H	06H-6012-B
Custom 168H	06H-6012-B

Cylinder Blocks—Cylinder blocks with fitted pistons furnished as follows:

Part No.	Size
06H-6014-A	Std.
06H-6014-B	.015" Oversize
06H-6014-C	.030" Oversize

REPLACEMENT PISTONS:—Finished pistons are furnished in Standard Size & Oversizes as listed below with each size graded in steps as follows:

Standard Pistons

Part No.	Size
06H-6110-B2	2.8732-2.8735"
06H-6110-B4	2.8743-2.8746"
06H-6110-B6	2.8755-2.8758"
06H-6110-B8	2.8767-2.8770"

.015" Oversize

06H-6110-C2	2.8882-2.8885"
06H-6110-C4	2.8893-2.8896"

.030" Oversize

06H-6110-D2	2.9032-2.9035"
06H-6110-D4	2.9043-2.9046"

PISTON PIN FITTING:—**Steel Pistons.** Pins can be removed and installed without heating pistons. Pins, pistons, and rod bushings held to close limits so that no fitting required. Clearances can be checked as follows:

Pin Fit in Piston—With piston and pin at same temperature and clean, pin should drop through pin hole in piston (total clearance not to exceed .0007").

Pin Fit in Rod Bushing—With pin installed, hold pin so that rod hangs vertically, then rotate pin. Lower end of rod should move upward through arc not greater than ½" before dropping back to vertical position.

PISTON RINGS:—Piston Rings (and Expanders for #2 Compression Ring & Oil Ring) are furnished in Sets in Cartons and single as listed below (Rings should be ordered in sets).

Sets in Cartons
(Steel Segment Type)

Part No.	Size
06HS-6149-A	Standard
06HS-6149-B	.015" Oversize
06HS-6149-C	.030" Oversize

Single Rings
Upper Compression (No Expander)

Part No.	Type	Size
06H-6150-B		Standard
06H-6150-C		.015" Oversize
06H-6150-D		.030" Oversize

Lower Compression (With Expander)

06HS-6152-A	Steel Segment	Standard
06HS-6152-B	Steel Segment	.015" Oversize
06H-6152-C1	Muskegon	.015" Oversize
06H-6152-C2	Sealed Power	.015" Oversize
06HS-6152-C	Steel Segment	.030" Oversize
06H-6152-D1	Muskegon	.030" Oversize
06H-6152-D2	Sealed Power	.030" Oversize

Oil Control (With Expander)

06HS-6153-A	Steel Segment	Standard
06HS-6153-B	Steel Segment	.015" Oversize
06H-6153-C1	Muskegon	.015" Oversize
06H-6153-C2	Sealed Power	.015" Oversize
06HS-6153-C	Steel Segment	.030" Oversize
06H-6153-D1	Muskegon	.030" Oversize
06H-6153-D2	Steel Power	.030" Oversize

Piston Ring Identification—Muskegon and Sealed Power Rings and Expanders may be identified by following markings and differences:

Lower Compression Ring

Muskegon—Ring has word 'Top' stamped 42° above slot. Expander has 6 crimps.

Sealed Power—Ring has word 'Top' stamped 25° below slot. Expander has 7 crimps.

Oil Control Ring

Muskegon—Ring has 9 slots. Expander has 6 crimps and 5 slots.

Sealed Power—Ring has 8 slots. Expander has 7 crimps and 6 slots.

TIMING GEARS:—**Camshaft Gear**—New type aluminum alloy camshaft gear is bolted on camshaft hub flange by four offset capscrews and can be replaced without removing camshaft from engine. To remove gear, remove screw in front end of crankshaft, pull fan and dampener assembly (use Puller 6130-A), remove timing gear cover. Bend back lockplate tangs and take out four camshaft gear mounting screws, remove gear. When replacing gear, make certain that marks on camshaft gear and crankshaft gear are lined up and see that lockplate tangs are bent up against flats on mounting screws. Use 6360-B Dampener Replacer tool to install dampener assembly.

NOTE—Camshaft gear mounting screw holes are offset so that gear can only be installed in correct position.

Crankshaft Gear—To replace crankshaft gear, pull fan and dampener assembly (see Camshaft Gear Removal above), use 6306-C puller to remove crankshaft gear, 6306-D Gear Replacer to install gear.

VALVE SERVICING:—Complete valve assembly (valve, spring, guide) should be removed from the engine and dismantled on the bench as follows:

Valve Assembly Removal—Use special bar type lifter, VZ-185, inserting end of lifter through spring coils to engage flanged lower end of guide, pull guide down slightly to release retaining 'C' washer, pull 'C' washer out, lift valve assembly out through top of block.

Valve Assembly Dismantling—Use special bench fixture to compress valve spring so that spring retainer can be removed, then remove spring, separate guide halves and remove valve. Re-assemble valves in same manner.

Valve Installation Note—Intake valve guides have relief groove cut on one edge of each guide half. Install guides with this relief groove up.

Valve Seat Insert Grinding:—Manufacturer recommends use of eccentric grinding equipment to reface seat inserts (inserts are high-tungsten, chrome-alloy steel and are exceedingly hard).

Hydraulic Valve Lifter Servicing:—When lifters removed they should be installed dry (will fill with oil and become quiet more rapidly than if installed with oil film between plunger and cylinder which will trap air in unit). Whenever lifters removed from engine, service as follows:

Lifter Installation—Remove plunger from lifter body, wash out all oil, dry with air, re-install plunger in lifter body and install in engine.

CAUTION—Plunger is selective fit in lifter body and must not be interchanged. Make certain that each plunger re-installed in same lifter from which removed.

Lifter Clearance—Clearance between plunger and valve stem must be .030-.070" with no oil in unit and plunger and spring fully compressed. To check this clearance, see that lifter is on heel of cam, use screwdriver to fully depress plunger in lifter body, check clearance with feeler gauge.

See article in Mechanical Equipment Section for complete Wilcox-Rich 'Zero-lash' hydraulic lifter servicing data.

ENGINE HOOD NOTE:—Hood is Alligator type with release knob under instrument panel at extreme left side. To raise hood, pull out on release knob (hood will raise slightly), press in on safety catch under front edge of hood.

OIL PAN REMOVAL:—*See Lincoln Shop Notes for data.*

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left side of front frame cross-member.

ENGINE SPECIFICATIONS:—Own Model 06H. 12 cylinder 75° Vee, L head type. Both blocks and crankcase cast enbloc. **Bore**—2.875". **Stroke**—3.75".
Rated Horsepower—39.6. **Displ'mt.**—292 cu. ins.
Developed Horsepower—120 at 3500 RPM.
Compression Ratio—7.2-1 Std. aluminum head.
Compression Pressure—154 lbs. at 1000 RPM. or 110 lbs. at cranking speed of 100 R.P.M.
Vacuum Reading—18-20" steady idling at 5 M.P.H.

PISTONS:—Steel alloy, light weight, cam-ground, with slipper type skirt. Recondition cylinders for finished replacement pistons.
Weight—360 grams (without rings or pin).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.

Replacement Pistons:—*See Lincoln Shop Notes for replacement piston and reconditioned block data.*

Fitting New Pistons:—Use .002" feeler, .50" wide, inserted between piston and cylinder wall at right angle to pin. Pull to withdraw feeler—3-6 lbs.

PISTON RINGS:—Two compression, one oil ring, all above pin. Oil ring groove drilled with drain holes. NOTE—Expander used with #2 Compr. and oil ring. Install this #2 Compr. ring with mark 'TOP' up.

Ring	Width	End Gap	Side Clearance
Compr. #1	.093-.0935"	.008-.013"	.0025-.003"
Compr. #2	.093-.0935"	.008-.013"	.002-.0025"
Oil Contr.	.1845-.185"	.008-.013"	.0015-.002"

Replacement Rings:—*See Lincoln Shop Notes for complete Ring and Expander size data.*

PISTON PIN:—**Diameter** .7501-.7504". **Length** 2.607". Floating type (locking ring in piston at each end). Pin hole in connecting rod bronze-bushed.
Pin Fit in Piston—.0005" clearance.
Pin Fit in Rod—.0001" clearance.
See Lincoln Shop Notes for pin fitting data.

CONNECTING ROD:—Length 7.40". **Weight** 638 grams.
Crankpin Journal Diameter—2.126".
Bearing Type—Steel-backed, copper-lead lined bearing halves clamped in each rod.
Clearance—.001". **Sideplay**—.002-.006".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. NOTE—Engage tang on bearing in groove in rod and cap. See that long and short bearing cap bolts installed on correct side (rod split at angle, bolts unequal length).

Replacement Bearings:—Furnished Std. and .0015", .003", .020", .040" Undersize.

Installing Rods:—Marks on rods and caps must be together and installed in same numbered cylinder with marks pointing down toward oil pan.

CRANKSHAFT:—Four bearing with integral counterweights. NOTE—Crankshafts furnished Std. and .020", .040" undersize.
Journal Diameters—2.401" (all bearings).
Bearing Type—Steel-backed, copper-lead lined.
Clearance—.001" (or slight drag with .002" feeler assembled in bearing for clearance check).

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps. NOTE—See that tang on bearing engages groove in block and cap.

Replacement Bearings:—Furnished Std. and .0015", .003", .020", .040" Undersize.

End Thrust:—Taken by rear main bearing. To adjust, replace bearing. **Endplay**—.002-.006".

CAMSHAFT:—Four bearing with Helical Gear drive. NOTE—Camshaft gear Aluminum-alloy type and is bolted on camshaft.
Journal Diameters—1.797" (all bearings).
Bearing Type—Steel-backed, babbitt-lined bushings pressed in block. **Clearance**—.002".

End Thrust:—Taken by gear hub and coverplate. Adjusted by replacing coverplate. **Endplay**—.005-.015".

Timing Gears:—Cast alloy iron (Crankshaft), New Aluminum Alloy—bolted on shaft (Camshaft).
Backlash—.004" Maximum.
See Lincoln Shop Notes for Timing Gear data.

Camshaft Setting:—Mesh marked tooth of crankshaft gear with space marked by line on camshaft gear (this line must be in line with mark on hub). NOTE—Cap screw holes in camshaft gear and shaft are unevenly spaced insuring correct gear position.

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1.537"	.3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.292"	.0015-.0035"

NOTE—Valve Seat Inserts used for exhaust valves.
See Lincoln Shop Notes for Valve Servicing data.

Tappet Clearance:—None (hydraulic type lifters).

Valve Guides:—Cast iron, split type. Retained by 'C' washer and valve spring. *See Lincoln Shop Notes.*

Valve Lifters:—Barrel type, hydraulic tappet take-up (Wilcox-Rich Zero-lash type). Diameter .9995".
For complete data, refer to 1941 Mech. Equip. Index.

Valve Springs:	Pressure	Length
Valve Closed	51-57 lbs.	2.13"
Valve Open	111-121 lbs.	1.84"

Valve Timing:—See Camshaft Setting above.
Int. Valves—Open 10.42° BTDC. Close 35.58° ALDC.
Exh. Valves—Open 50.92° BLDC. Close 8.08° ATDC.
To Check Timing—No flywheel marks provided. If dead center position for any cylinder established on flywheel, intake valve for this cylinder should open approx. 3.24 teeth before this point with piston .0389" before top dead center.

LUBRICATION:—Pressure type with gear type oil pump in crankcase at rear of engine.
Normal Oil Pressure—40-45 lbs. at 2000 R.P.M.

Oil Pressure Regulator:—Above crankshaft bearing between cylinder banks at front end of engine. Opens at 50 lbs. Not adjustable.

Oil Pressure Gauge:—King-Seeley Electric. Ford No. 16H-9273 (Dash Unit—Zephyr 16H & Custom 168H), 06H-9273-B (Dash Unit—Continental). No. 48-9278 (Engine Unit—All Models).
For complete data, refer to 1941 Mech. Equip. Index.

Crankcase Capacity:—5 qts.

COOLING SYSTEM:—Capacity—27 quarts.

Water Pump:—Packless type, 2 used (1 for each bank).
For complete data, refer to 1941 Mech. Equip. Index.
Removal—Slack off drive belt, disconnect hose couplings, take out mounting screws on pump.

Thermostat:—In outlet hose for each bank (2 used).
Setting—Starts to open at 145°F. Fully open 180°F.

Temperature Gauge:—King-Seeley Electric. Ford No. 16H-10883 (Dash Unit—Zephyr 16H & Custom 168H), 06H-10883-B (Dash Unit—Continental). No. 99A-10884 (Engine Unit—All Models).
For complete data, refer to 1941 Mech. Equip. Index.

CLUTCH:—Long Model 10CF-TI. Semi-centrifugal single plate, dry disc type.
For complete data, refer to 1941 Mech. Equip. Index.
Facings—Woven type, 2 required. Inside Diam. 6". Outside Diam. 10". Thickness .140".

Adjustment:—Pedal free movement must be 1.5-2.0". To adjust, loosen locknuts, turn clevis on connector link.
Removal:—Slide transmission and rear axle to rear as a unit to expose clutch (see Transmission Removal below), take out mounting screws in clutch cover.

TRANSMISSION:—Own Make. Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse), all helical gear type.
For complete data, refer to 1941 Mech. Equip. Index.

Overdrive (Optl.):—Warner Model AS1-R10. Type R10 overdrive with electrical solenoid control (no centrifugal clutch pawls) and 'kick-down' feature.
For complete data, refer to 1941 Mech. Equip. Index.

Transmission Control:—Mech. steering column shift.
For complete data, refer to 1941 Mech. Equip. Index.

Removal:—Disconnect hand brake cable, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection. Take off universal joint ball housing bolts, slide axle assembly to rear. Disconnect shifter rods from lever at transmission. Support engine at rear, take out rear engine mounting bolts, remove clutch housing mounting screws, pull transmission straight back.

UNIVERSAL JOINT:—Spicer Model 2102-1. Needle bearing type. Single joint at rear of transmission.
For complete data, refer to 1941 Mech. Equip. Index.

REAR AXLE:—Own Model. ¾ floating, Hypoid Gear type with Torque Tube drive.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—4.44-1. **Backlash**—.002-.004".
For complete data, refer to 1941 Mech. Equip. Index.

Removal:—Disconnect hand brake cable, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection, take out universal joint ball housing bolts, pull axle assembly to free shaft at joint.
Axle Shaft Removal—*Refer to Mechanical Equipment Index for article on Lincoln Rear Axle for data.*

SHOCK ABSORBERS:—Houde (Houdaille). Type BBCHN (Front), BBCLZ (Rear). Lincoln No. 16H-18045 (Right Front), 16H-18046 (Left Front), 16H-18080 (Right Rear), 16H-18081 (Left Rear). Double acting, hydraulic, adjustable type.
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—Steering Gear—Gemmer Model No. 330. Worm-and-roller type.
For complete data, refer to 1941 Mech. Equip. Index.

Front Suspension:—Conventional I-beam section axle with Reverse-Elliott ends and transverse spring. Axle positioned by radius rods and strut rod (anti-sway bar).
Kingpin Inclination—4° crosswise.
Caster—3° Min., 5° Max. Must be equal for both wheels within ½°. No adjustment.
Camber—¼° Min., ¾° Max. Must be equal for both wheels within ¼°, right wheel must not exceed left.
Toe In—1/16". Set at 1-10 ratio to Camber. To adjust, loosen clamp bolts, turn tie rod.
Steering Geometry (Toe out on turns)—Inner wheel turned 23°, outer 20°. Allowable variation ½°.

BRAKES:—Service—Bendix-Hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies all four service brakes.
For complete data, refer to 1941 Mech. Equip. Index.
Wheel Cylinders—Diameter 1.125" (front), 1.00" (rear). Not interchangeable from one wheel to another. **Drums**—Diameter 12".
Lining—Molded (primary or forward shoe), Woven (secondary shoe). Width 1.75". Thickness .21", Length per shoe 11.95".
Clearance—.010" at each end of each shoe.

Hand Brake:—See Service Brakes above.

FORD TRUCK NOTE:—All Mercury Engine data below applies also to Ford Truck Models with '95' Engine

ENGINE HOOD NOTE:—Hood is Alligator type with release knob under instrument panel to left of steering column. To raise hood, pull out on release knob (hood will raise slightly), press in on safety catch under front edge of hood.

OIL PAN REMOVAL:—*See Ford Shop Notes for data.*

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left frame member in front of dash bracket.

ENGINE SPECIFICATIONS:—**Own 95.** 8 Cylinder, 90° Vee, L head. Both banks & crankcase cast enbloc.
Bore—3.187". **Stroke**—3.75".
Rated Horsepower—32.5. **Displacement**—239 cu. ins.
Developed Horsepower—95 at 3600 RPM.
Compression Ratio—6.3-1 (Mercury & Ford Comm'l. with 95 Eng.), 5.9-1 (Ford Trucks). Cast iron type.
Compression Pressure—145 lbs. (6.30-1 hd.), 134 lbs. (5.9-1 hd.) at 2400 RPM max. 100 lbs. at 100 RPM.
Vacuum Reading—Steady 18-20" at 5MPH.

CYLINDER SLEEVES:—Hardened, dry type cylinder sleeves used on engines marked 'HS' on cylinder block above upper front corner of left cylinder head.
Servicing—*See Ford Shop Notes for complete data.*

PISTONS:—Steel alloy, light weight, cam ground type or Aluminum alloy, T slot type. Recondition engine to take finished replacement pistons (replace Sleeves and install Std. pistons on engines with sleeves).
Weight—Without rings or pin, 358-362 grams (Mercury), 364-368 grams (Ford Truck).
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Replacement Pistons:—*See Ford Shop Notes for data.*
Fitting New Pistons:—Use .50" wide feeler stock of correct thickness inserted between piston and cylinder wall at right angles to pin to check clearance. Pull to withdraw feeler 6-10 lbs. (all types).

Feeler Thickness for:	Steel—Pistons	Aluminum
Engines with Sleeves	.003"	.0025"
Engines without Sleeves	.0025"	.002"

PISTON RINGS:—Two compression, one slotted oil ring, all above pin (drain holes in oil ring groove).
NOTE—Expander used with #2 Compr. and oil ring.

Ring	Width	End Gap	Side Clearance
Compr. #1	.0915-.0920"	.012-.017"	.0025-.003"
Compr. #2	.0915-.0920"	.012-.017"	.002-.0025"
Oil Contr.	.1535-.1540"	.012-.017"	.0015-.002"

Replacement Rings:—Furnished (sets in carton only) Std. and .005", .015", .030", .045", .060" oversize.

PISTON PIN:—**Diameter** .7501-.7504". **Length** 2.975". Floating type (locking ring in piston at each end). Pin hole in connecting rod bronze-bushed.
Pin Fit in Piston—.0005" clearance.
Pin Fit in Rod Bushing—.0001" clearance. *See Ford Shop Notes for Pin Fitting Directions and Oversizes.*

CONNECTING ROD:—**Length** 7.002". **Weight** 488 grams.
Crankpin Journal Diameter—2.139" (connecting rod diameter on crankpin—2.360").
Bearing Type—Steel-backed, special-alloy lined. Bearing floats in both rods (side-by-side mounting) with bearing surface on both inner and outer face.
Bearing Dimensions—Length 1.747". Thickness .1095". These bearings do not have end flanges.
Clearance—.0005-.002" (total diametrical).
Sideplay—.010-.022" (total).
Bearing Adjustment:—None (no shims). Do not file.
Replacement Bearings:—*See Ford Shop Notes for special bearings for oversize rods and undersize crankpins.*
Installing Rods:—Marks on rods and caps must be together and installed in same numbered cylinder with marks pointing down toward oil pan.

CRANKSHAFT:—3 bearing. Integral counterweights.
Journal Diameters—2.499" (all bearings).
Bearing Type—Steel-backed, special-alloy lined.
Clearance—.001-.003" (or slight drag with .002" feeler assembled in bearing for clearance check).
Bearing Adjustment:—None (no shims). Do not file.
End Thrust:—Taken by rear main bearing. Adjust by replacing bearing. **Endplay**—.002-.006".
Replacement Bearings:—*See Ford Shop Notes for Undersizes and special long main bearings.*

CAMSHAFT:—3 bearing. Helical gear drive (2 types of camshaft gears used—Bakelized Fabric pressed on shaft or new Aluminum Alloy type bolted on shaft).
Bearing Diameters—1.797" (all bearings).
Bearings—Steel-backed, babbitt-lined bushings.
Clearance—.002".
End Thrust:—Taken by gear hub and cover plate. Adjusted by replacing coverplate. **Endplay**—.005-.015".
Timing Gears:—Cast alloy iron (crankshaft), Bakelized Fabric—pressed on shaft, or Aluminum Alloy—bolted on shaft (camshaft). **Backlash**—.004" max. *See Ford Shop Notes for Timing Gear Replacement.*
Camshaft Setting:—Mesh '0' marked tooth of crankshaft gear with '/' marked space on camshaft gear (this mark must be in line with mark on hub).

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1.537"	.3115"	4.750-4.751"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	.292"	.0015-.0035"

See Ford Shop Notes for Valve Servicing data.
NOTE—Seat inserts used for all valves.
Tappet Clearance:—.0125-.0135". No adjustment.
Valve Guides:—Split type retained by 'C' washer and valve springs. *See Ford Shop Notes for servicing data.*
Valve Lifters:—Barrel type in reamed holes in block. **Diameter**—.9995". **Clearance**—.0005-.001".

Valve Springs:	Pressure	Length
Valve Closed	37-40 lbs.	2.13"
Valve Open	76-80 lbs.	1.84"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 44° ALDC.
Exhaust Valves—Open 48° BLDC. Close 6° ATDC.
To Check Valve Timing—No flywheel marks provided. Intake valve opens with piston at TDC.

LUBRICATION:—Pressure. Gear type oil pump mounted in crankcase at rear of engine.
Normal Oil Pressure:—30 lbs. at 2000 R.P.M.
Oil Pressure Regulator:—Under plug above front camshaft bearing. Opens at 30 lbs. Not adjustable.
Oil Pressure Gauge:—King-Seeley Electric. Ford No. 19A-9273 (Dash Unit), No. 48-9278 (Engine Unit). *For complete data, refer to 1941 Mech. Equip. Index.*
Crankcase Capacity:—5 quarts.

COOLING SYSTEM:—**Capacity** 25½ quarts.
Water Pump:—Packless type, 2 used (1 for each bank). *For complete data, refer to 1941 Mech. Equip. Index.*
Removal—Slack off drive belt, support engine at forward end, remove front engine mounting bolts, take out mounting screws in pump body.
Thermostat:—In each cylinder head outlet (2 used).
Setting—Starts to open at 145°F. Fully open 180°.
Temperature Gauge:—King-Seeley Electric. Ford No. 19A-10883 (Dash Unit), No. 99A-10884 (Eng. Unit). *For complete data, refer to 1941 Mech. Equip. Index.*
NOTE—Gauge reads 'Hot' when turned off.

CLUTCH:—**Long Model 10CF-TI.** Single plate, dry disc, semi-centrifugal. NOTE—Clutch is new larger type. *For complete data, refer to 1941 Mech. Equip. Index.*
Facings—Woven type, 2 required. Inside Diam. 6¾". Outside Diam. 10". Thickness .125".
Adjustment:—Pedal free movement must be 1.0-1.25". To adjust, remove pin at throw-out shaft lever end of connecting link, turn clevis on link rod.
Removal:—Slide rear axle and transmission to rear as a unit to expose clutch (see Transmission Removal below), take out mounting screws in cover.

TRANSMISSION:—**Own Make.** Constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse), all helical gear type.
For complete data, refer to 1941 Mech. Equip. Index.
Transmission Control:—Mech. steering col. shift.
For complete data, refer to 1941 Mech. Equip. Index.
Removal:—Disconnect gear shifter rods at levers on transmission case. Disconnect rear shock absorbers, hand brake cables, hydraulic brake line at torque tube connection (bleed lines when re-connected), speedometer cable. Disconnect rear spring at center frame connection. Take out universal joint ball housing screws, slide rear axle assembly back to disengage drive shaft at splined joint. Support engine at rear, take out rear engine mounting bolts, and clutch housing screws. Remove transmission.

UNIVERSAL JOINT:—**Spicer Model 202-6.** Steel bushing type. Single joint at rear of transmission case. *For complete data, refer to 1941 Mech. Equip. Index.*

REAR AXLE:—**Own Make.** ¾ floating, Spiral Bevel Gear type with Torque Tube drive.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—3.54-1 Std., 3.78-1 & 4.11-1 Optl.
Backlash—.010" maximum.
Optional Axle:—Columbia Two-speed type.
For complete data, refer to 1941 Mech. Equip. Index.
Removal:—Disconnect rear shock absorbers, hand brake cables, hydraulic brake line (at torque tube connection—bleed lines when re-connected), speedometer cable, shock absorber links. Disconnect rear spring at center frame connection. Take out universal joint ball housing screws, pull axle assembly to rear to disengage drive shaft at splined joint.
Axle Shaft Removal—*Refer to 1941 Mech. Equip. Index for article on Ford and Mercury Rear Axle.*

SHOCK ABSORBERS:—**Houde (Houdaille).** Type BBCN (Front), BBCZ (Rear). **Ford Nos.—Front** 11A-18045A (Right), 11A-18046A (Left). **Rear** 11A-18080A (Right), 11A-18081A (Left). Hydraulic, double-acting, adjustable type.
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—**Steering Gear**—Gemmer Model 305 Worm-and-Roller type with 'push-pull' adjustment.
For complete data, refer to 1941 Mech. Equip. Index.
Front Suspension:—Conventional 'I' beam section front axle with Reverse Elliott ends and transverse spring. Axle positioned by radius rods.
Kingpin Inclination—8° crosswise.
Caster—9° Max., 4½° Min. Must be equal within ½°. Axle may be bent cold to correct caster if proper tools (wedges and blocks to prevent crushing axle flange) are used.
Camber—1° Max., ¼° Min. Must be equal within ¼°, right wheel must not exceed left. Adjust in same manner as for caster (see caster data above).
Toe In—1/16". Set at 1-10 ratio to Camber. Adjust by loosening clamp bolts and turning tie rod.
Steering Geometry (Toe Out on Turns)—Outer wheel turned 20°, Inner wheel 23⅓°. No adjustment.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand lever applies rear service brakes.
For complete data, refer to 1941 Mech. Equip. Index.
Drum—Cast iron. Diameter 12".
Wheel Cylinders—Stepped type as follows:
Front Wheel....1.25"-1.00". Rear Wheel....1.125"-1.00".
Lining—Woven (all shoes). Width 1.75". Thickness .20". Length per shoe 13.18" (forward shoes), 10.1" (rear shoes).
Clearance—Least possible amount without drag.
Hand Brake:—See Service Brakes above.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

HOOD LOCK:—Alligator type hood hinged at cowl. Hood lock button located on left side under instrument panel. Removable hood side panels used.

ENGINE CODE (ORIGINAL BORE & BEARING SIZES):—Engines factory-equipped with oversize bores or undersize main or connecting rod bearings carry a three letter code for identification. **Standard engines carry no code mark.**

Code Mark Location—Three letter code stamped adjacent to engine number on cylinder block.

Letter Position—Three letter code used. Position of letter indicates the following:
1st Letter—Original Bore Size.
2nd Letter—Main Bearing Journal Size.
3rd Letter—Crankpin Journal Size.

Size Identification—Letters indicate following:
'A'—Standard size (bore or bearing sizes).
'B'—.010" Undersize (main or con rod bearings).
'C'—.010" Oversize (bore size with .010" OS Pistons).

PISTON RINGS:—Installation—A plain top compression ring is used on all models and must be installed with bevel on upper inner edge toward top of the piston. A taper faced compression ring is used in second ring groove with a plain expander installed behind it. This ring should be installed with taper extending out toward the bottom. In #3 ring groove (below piston pin on Model 4140), #3 and #4 ring grooves (above piston pin on Models 4160 and 4180), slotted type oil rings with a ventilated type expander installed behind ring is used. Ring fit correct with *.010-.015" End Gap* and *.002-.004" Side* Clearance. Stagger end gaps of rings and expanders on piston.

Replacement Piston Rings—Statite piston rings furnished by car manufacturer for service. These rings can be installed in cylinder bores up to .009" taper or .003" out-of-round for correction of excessive oil consumption using same pistons.

CONNECTING ROD:—Bearing Removal & Installation. Removable bearing shells used. To remove bearings, take off bearing caps, remove bearings from rod and cap. Fit bearings as directed below. When installing bearings, oil hole in upper half should register with oil spit hole in rod. Tongue on each bearing should engage groove in rod and cap.

Replacement Bearings—Finished bearings furnished standard and .002", .010" undersize.

Fitting Bearings—Same procedure as listed for Main Bearings following with the same feeler stock.

Palnut (Rod Bolt Locknut) Installation—Palnuts used to lock connecting rod bolt nuts in place of cotter pin. Tighten bolt nuts to 27-30 ft. lbs. tension on 4140, 50-55 ft. lbs. tension on 4160 and 4180, with a tension wrench. Lock bolt nuts in place by installing new palnuts. Install with smooth face toward nut, draw nut up tight but do not overtighten.

VIBRATION DAMPENER:—Model 4140 & 4160. Non-adjustable, rubber-cushioned vibration dampener mounted on forward end of crankshaft. Outer flywheel secured to dampener hub by rubber-cushioned bolts. On Model 4140, a cork seal and rubber seal ring installed between front end of crankshaft and hub retainer. Hub assembly installed as follows: Lock hub on shaft with woodruff key, install large lockwasher with notches on inner edge, cork seal, rubber seal ring and hub retainer in recess in hub, install hex head lock screw with helical lockwasher under it in screw hole in end of crankshaft and tighten screw securely. On Model 4160, dampener hub retained by a special nut with shakeproof lockwasher (no seals installed behind hub retainer as on 4140). On all models, rubber block retaining bolt nuts on front face of dampener hub must be drawn up tight. No adjustment provided. Two oil wicks under brass plugs on outer edge of dampener should be oiled every 2000 miles. Remove plugs, saturate oil wicks with light engine oil.
IMPORTANT NOTE—When installing front flywheel on hub, timing marks must be in line with hub key-way and on the same side. Whenever new front flywheel installed, balance holes must be duplicated as to size and depth for proper balance.

Model 4180—An adjustable, rubber-cushioned vibration dampener mounted on forward end of crankshaft. Consists of hub retained on end of crankshaft by a special nut. Pulley secured to front face of hub by four screws. Two rubber cushions assembled on each screw, rear half installed with shoulder toward hub, front half with shoulder toward circular ring. This ring fits in recess on front face of pulley and screw holes are provided for assembling ring under screws. All four screws should be drawn down evenly and inner ends (on rear side of hub) should be peened to lock screws in place. Screw tension can be adjusted to eliminate knock caused by vibration dampener. Fan belt tension should be checked first since excessive belt tension will cause dampener to knock. Oil dampener in same manner as for 4140 & 4160 above.
CAUTION—See Important Note above.

MAIN BEARINGS:—Removal & Installation—Upper bearing halve may be 'rotated' out by inserting pin in oil hole in crankshaft and turning shaft in the direction of locating tongue on bearing. Bearings can be installed by reversing removal procedure

Replacement Bearings—Finished bearings which require no reaming or scraping are furnished standard size and .002", .010" undersize.

Fitting Bearings—To check bearing clearance, insert short piece of .002" feeler stock, ½" wide, lengthwise to crank pin between bearing and crankshaft, tighten cap. Bearing fit correct when a definite drag is felt when rotating crankshaft (CAUTION—Do not rotate crankshaft more than 1" in either direction). If no drag felt, replace bearings with proper undersize (as listed above) until bearing fit correct. Do not shim bearings or file caps.

Replacement Main Bearing Caps—On 6 cyl. engines replace caps as follows: Align bore in cap with bore in crankcase by filing sides of cap (caps fit in recess in block). To assure correct alignment, cap retaining screws should be tightened, then backed off slightly and crankshaft rotated allowing cap to be properly positioned, tighten retaining screws to 66-70 ft. lbs. tension with tension wrench. On eight cylinder engines, replace caps as follows: Install caps on engine, tighten retaining screws, back off screws slightly, line up dowel holes in cap and crankcase (original caps doweled in place when bearings line-bored) to align bore in cap with bore in crankcase, tighten screws to 70-73 ft. lbs.

Rear Main Bearing Oil Seal (4140)—Hemp packing fitted in groove in crankcase and cap behind oil slinger on crankshaft. Cap sealed with rubber plugs in groove on each side where cap fitted in recess in block. Use Tool J-1610 to install packing in groove in cap and block. Place packing in groove (with bearing shell removed), place small diameter of tool over packing, hit end of tool with lead hammer to seat packing, cut ends of packing flush with bearing cap seat, remove tool. Repeat operation for groove in block. Install plugs on sides of cap.
4160—A reverse thread oil slinger on crankshaft rotates in line with cored groove in block and cap. No seal installed in this groove. Groove in cap provided with two 13/32" diameter oil return holes. Cap sealed with straight grain pine wood seal plugs installed in groove on each side of cap where cap fitted in recess in block. With bearing cap off, check clearance between oil slinger threads and bore in block and cap. Clearance must be .006-.008" uniformly around shaft to provide eccentric oil thread. If clearance too small, file crankshaft thread (CAUTION—Do not alter bore in block and cap for clearance adjustment). Clean seal plug grooves in cap to provide flat and smooth surfaces. After bearing cap installed, place gasket compound on inner end of plug, tap plug carefully in place in groove on each side of cap, cut off ends of plugs flush.
4180—Reverse threads cut on crankshaft behind oil slinger. Slinger turns in line with cored groove in block and cap. No seal installed in this groove. Groove in cap provided with oil return holes. Clearance between threads (behind oil slinger) and bore in block (behind oil slinger groove) should be .006-.008". Check with cap off engine. If clearance too small file threads on crankshaft. Cap sealed to oil pan with cork gasket. Rear edge of cap sealed to flywheel housing pan by an additional cork gasket.

CRANKSHAFT END THRUST PLATE (4140):—Crankshaft end thrust taken by flanged edges of front bearing. A steel thrust plate is assembled between rear face of timing chain sprocket and flanged face of front bearing. Plate keyed to shaft by woodruff key which also secures sprocket on shaft. When plate installed, chamfered edge on inner diameter should face toward the rear for tight fit against bearing journal. See Crankshaft Front Oil Seal below.

CRANKSHAFT FRONT OIL SEAL:—Models 4140 & 4160. A felt seal is fitted in the timing chain cover which bears against vibration dampener hub. Seal seat in cover has inner edge turned up to form a shedder on inside of cover. An oil slinger is assembled behind vibration dampener hub which extends over outer edge of oil shedder. Use Tool J-1430 installed on end of crankshaft when tightening timing chain cover screws to align seal properly. NOTE—On Model 4140 a cork seal and rubber seal ring is assembled behind vibration dampener to seal front end of crankshaft. See Vibration Dampener above for data.

Model 4180—Oil threads formed on rear of vibration dampener hub with an oil slinger assembled behind hub. A steel-bushing is assembled in opening in timing chain cover. Use Tool J-1430 installed on end of crankshaft when tightening timing chain cover screws to align steel bushing properly.

CAMSHAFT REMOVAL:—Model 4140. Special valve tappet retaining clips (supplied in sets of 16—Tool No. J-1612) available for camshaft removal without necessity of removing valves or cylinder head. Clips can be installed between spring seat and block.

Models 4160 & 4180—Tappets on these engines can be retained by rubber bands or hacksaw blade

SELF-LOCKING TAPPET SCREWS (4140):—No locknut used on tappet adjusting screw. Threaded bushing welded to top of tappet with threads out of index with threads in tappet which locks tappet screw in position. Screw tension should be 50 inch lbs.

HOOD LOCK & ENGINE CODE (BORE & BEARING SIZES) NOTE:—*See Nash Shop Notes for data.*

SERIAL NUMBER:—First No. K-5001. Stamped on plate on right side of cowl under engine hood.
Service Serial Number—N4-5001 Up. On plate on right front door hinge pillar.

ENGINE NUMBER:—First No. K-5001 (same as Serial No.). Stamped on left side of engine block at front

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. Cylinders cast Enbloc with intake manifold cast in block (Iso-thermal fuel intake system).
Bore—3⅛". **Stroke**—3¾".
Displacement—172.6 cu. ins. **Rated HP**—23.44.
Developed Horsepower—75 at 3600 RPM.
Compression Ratio—6.7-1 Std. (cast-iron head).
Compression Pressure—120 lbs. at 350 RPM.
Vacuum Reading—18-20" idling at 6 MPH.

PISTONS:—Aluminum alloy, Autothermic, cam-ground, tin-plated type. **Length**—3⅜".
Original Bore Sizes:—*See Engine Code Note in Nash Shop Notes for data.*
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Replacement Pistons:—Furnished std. and .001", .002", .003", .005", 010", .012", .015", .020", .040" oversize.
Fitting New Pistons:—Use .002" oiled feeler ½" wide between piston and wall at right angles to pin hole on side opposite slot. Pull to withdraw feeler must be within 12-18 lbs. with piston at room temperature.
Installing Pistons:—Pin offset toward camshaft and slot to left side (trademark on piston toward front).

PISTON RINGS:—Two compression, one oil ring per piston, all above pin. Oil ring groove drilled for oil drain.

Ring	Width	End Gap	Side Clearance
Compr.	.093"	.010-.015"	.002-.004"
Oil Contr.	.1865"	.010-.015"	.002-.004"

Replacement Rings & Installation Data:—*See Nash Shop Notes for complete data.*

PISTON PIN:—**Diameter**—.8120". **Length**—2.609". Floating type, retained by locking ring at each end. Pin hole in piston offset toward camshaft.
Pin Fit in Piston—Light push fit (piston at 200° F.).
Pin Fit in Rod Bushing—Select fit for .0001" clearance or light push fit at normal temperature.
Replacement Pins:—Standard, .001, .003" oversize.

CONNECTING ROD:—**Length**—6¾". **Weight**—24 ozs.
Upper Bearing (Piston Pin Bushing)—Bronze.
Crankpin Journal Diameter—2". *See Engine Code Note in Nash Shop Notes for original bearing sizes.*
Lower Bearing—Removable steel-backed babbitt.
Clearance—.0015-.0025". **Sideplay**—.004-.008".
Bearing Adjustment:—None (no shims). Replace bearings. *See Nash Shop Notes for instructions and 'Palnut' data.*
Replacement Bearings:—Std., .002", .010" undersize.
Installing Rods:—Mark rods and bearing caps before removal and install in same position. Oil hole in lower end of rod must be toward right of engine.

CRANKSHAFT:—Four bearing, counterweighted type. *See Nash Shop Notes for Vibration Dampener data.*
Journal Diameters—2 31/64" all bearings. *See Engine Code Note in Nash Shop Notes for Original bearing sizes.*
Bearings—Removable steel-backed babbitt type.
Clearance—.002".
Bearing Adjustment:—None (no shims). Replace bearings. *See Nash Shop Notes for bearing installation and fitting, replacement main bearing caps, and rear main bearing oil seal data.*
Replacement Bearings:—Std., .002". .010" undersize.
End Thrust:—Taken by #1 front bearing. *See Nash Shop Notes for thrust plate and oil seal data.*
Endplay—.004-.006".

CAMSHAFT:—4 bearing. Non-adjustable chain drive. *See Nash Shop Notes for Camshaft removal data.*
Bearing Type—Steel-backed, babbitt bushings.
Clearance—.002".
End Thrust:—Taken by front bearing and camshaft sprocket. **Endplay**—.004-.006".
Timing Chain:—Whitney No. 49205 roller chain. Width 9/16". Pitch ⅜". Length 22½" or 60 links.
Camshaft Setting:—Mesh chain with marks on camshaft and crankshaft sprockets adjacent and in line with straightedge across shaft centers. With camshaft turned so mark is 45° past (to right) of top vertical position, there should be 9½ links between marks.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 11/32"	.3412"	4¾"
Exhaust	1 9/32"	.3412"	4¾"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	5/16"	.002-.003"

Tappet Clearance:—.015" all valves, engine hot and idling (.018" max. may be used for sustained high speed driving). *See Nash Shop Notes for Self-locking type tappet adjusting screw data.*
Valve Guides:—Press fit in block (press in place 1" below top of block, ream for valve stem clearance).

Valve Springs:—	Pressure	Length
All Valves	83 lbs.	1 7/16"

Valve Lifters:—Mushroom type in guide holes reamed in block. Removed from below. *See Nash Shop Notes for Camshaft Removal (necessary to remove lifters).*
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 19° BTDC. Close 63° ALDC.
Exhaust Valves—Open 59° BLDC. Close 23° ATDC.
To Check Valve Timing—With .015" tappet clearance, #1 intake valve opens 19° BTDC with 'DC' mark on vibration dampener at front of engine 1 3/16" ahead of pointer on chain case cover. #1 exhaust valve closes 23° ATDC. with 'DC' mark 1 15/16" past the pointer.

LUBRICATION:—Pressure system. Gear type oil pump on right side of crankcase (driven by inclined shaft).
Normal Oil Pressure:—25-30 lbs. at 25 MPH (warm oil).
Oil Pressure Regulator:—Under plug on left side of crankcase behind pump. Opens at 25 lbs. Non-adj.
Crankcase Capacity:—5 quarts.

COOLING SYSTEM:—**Capacity** 14 qts. (15 with heater).
Water Pump:—Centrifugal, adjustable packing type. *For complete data, refer to 1941 Mech. Equip. Index.*
Removal—Drain radiator, disconnect hose and drive coupling, take out mounting screws in pump flange.
Thermostat:—Fulton or Dole. In cyl. head outlet.
Setting—Starts to open at 160° F.
Temperature Gauge:—Auto-Lite (Motometer) Vapor Tension type. Auto-Lite No. H-9706.
For complete data, refer to 1941 Mech. Equip. Index.

CLUTCH:—**Borg & Beck Model 8A7.** Assembly No. 959. Single plate, dry disc type.
For complete data, refer to 1941 Mech. Equip. Index.
Facings—Molded metallic type, 2 required. Inside Diam. 5⅜". Outside Diam. 8". Thickness ⅛".
Pedal Adjustment:—Free travel ½-1". Adjust by loosening one nut, tightening opposite nut on connector rod at clutch fork (tighten nuts to apply slight tension to rubber cushions, lock each nut with 'Palnut'.
Removal:—Remove transmission (see below), disconnect clutch pedal linkage, remove clutch housing and pan, punchmark flywheel, clutch cover and pressure plate (reassemble to same marks), take out clutch fork and mounting screws in cover flange. Remove clutch assembly.

TRANSMISSION:—**Warner Model AS3-T84G (Std.), AS4-T84G (with Overdrive).** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low and reverse).
For complete data, refer to 1941 Mech. Equip. Index.
Overdrive (Cruising Gear):—Warner Type R7C with electrical 'kick-down' control Optl.
For complete data, refer to 1941 Mech. Equip. Index.
Transmission Control:—Mech. steering column shift.
For complete data, refer to 1941 Mech. Equip. Index.
Removal:—Disconnect torque tube at trunnion bracket and remove Rear Axle (see below), disconnect shift rods and Overdrive control wires and cable, disconnect speedometer cable. Support engine at rear, remove rear engine mountings, take out transmission mounting bolts, pull transmission straight back and remove from below.

UNIVERSAL JOINTS:—**Mechanics No. 1½R.** Needle bearing type, 1 used (in rear bearing bracket at rear of transmission). NOTE—Universal joint is free fit on rear end of transmission mainshaft and press fit on forward end of propeller shaft.
For complete data, refer to 1941 Mech. Equip. Index.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Torque Tube Drive.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—4.1-1 Std. 4.4-1 with Overdrive.
Backlash—.005-.007".
Removal:—Jack up rear end of car and support securely with body jacks placed on either side of frame at point 6" forward of front end of rear fender (CAUTION—car weight must not rest on body frame flange which projects below frame rail). Disconnect stabilizer bar and rear spring and shock absorber mounting brackets from axle, disconnect trunnion bracket at transmission rear bearing bracket by removing nuts on forward ends of trunnion bracket mounting studs, pull axle to rear to disengage propeller shaft and universal joint assembly from transmission mainshaft, remove axle and torque tube assembly from under car. *Refer to Mech. Equip. Index 'Nash Rear Axle article' for Trunnion Bracket installation & adjustment, & shaft bearing data.*
Axle Shaft Removal & Wheel Bearing Adjustment:—Same as for other Nash models (see next page).
Rear Suspension:—Coil spring type with shock absorbers mounted within springs.
For complete data, refer to 1941 Mech. Equip. Index.

SHOCK ABSORBERS:— **Delco Model 1026-N (front), 1023-BB (rear).** Direct acting, hydraulic type.
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—**Steering Gear**—Gemmer Model 250. Worm-and-roller. *Refer to Mech. Equip. Index for data.*
Front Suspension:—New enclosed type with knuckle support and coil spring on kingpin mounted on frame cross-member.
For complete data, refer to 1941 Mech. Equip. Index.
Kingpin Inclination—5½° crosswise.
Caster—0° plus or minus ½°. Adjustable.
Camber—0° to ½° Pos. Adjustable.
Toe In—0-1/16" measured 10" up from floor. Adjusted by turning tube at outer end of each tie rod equally. CAUTION—Clamp bolts must be down toward ground to prevent interference with body during wheel movement.
Steering Geometry (Toe Out on Turns)—Inner wheel turned 21° plus ½°, Outer wheel 20°.

BRAKES:—**Service**—Lockheed hydraulic, double anchor type. Hand lever applies rear service brakes.
For complete data, refer to 1941 Mech. Equip. Index.
Drums—Cast iron. Diameter 9".
Lining—Moulded. Width 1¾". Thickness 3/16". Length 20½" per wheel.
Clearance—.008" toe, .004" heel for each shoe.
Hand Brake:—See Service Brakes above.

HOOD LOCK & ENGINE CODE (BORE & BEARING SIZES) NOTE:—*See Nash Shop Notes for data.*

SERIAL NUMBER:—First No. R-353001. On plate on right frame siderail under engine hood.
Service Serial Number—First No. N6-45001. Stamped on left front door pillar post.

ENGINE NUMBER:—First No. R-353001 (same as Serial No.). On right hand side of cylinder block at front

ENGINE SPECIFICATIONS:—6 cylinder, valve-in-head, Twin Ignition type with Iso-thermal fuel intake system (intake manifold cast in cylinder head—water jacketed for temperature control).
Bore—3⅜". **Stroke**—4⅜".
Displacement—234.8 cu. ins. **Rated HP**—27.34.
Developed Horsepower—105 at 3400 RPM.
Compression Ratio—6.3-1 Std. cast-iron head.
Compression Pressure—125 lbs at 350 RPM.
Vacuum Reading—Steady 18-20" idling at 7-8 MPH.

PISTONS:—Aluminum alloy, Autothermic, cam-ground, tin-plated type. **Length**—3⅞".
Removal—Pistons and rods removed from above.
Clearance—See Fitting New Pistons.
Original Bore Sizes:—*See Engine Code Note in Nash Shop Notes for data.*
Replacement Pistons:—Furnished std. and .001", .002", .003", .005", 010", .012", .015", .020", .040" oversize.
Fitting New Pistons:—Use .002" oiled feeler ½" wide between piston and wall on side opposite slot at right angles to pin hole. Pull to withdraw feeler must be 12-18 lbs. with piston at room temperature.
Installing Pistons:—Pin offset toward camshaft and slot toward left (trademark on piston toward front). NOTE—Piston pin offset 1/16".

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Oil ring grooves drilled for oil drainage.

Ring	Width	End Gap	Side Clearance
Compr.	.124"	.010-.015"	.002-.004"
Oil Contr.	.155"	.010-.015"	.002-.004"

Replacement Rings:—*See Nash Shop Notes for data.*

PISTON PIN:—**Diameter**—.8745". **Length**—2.804". Floating type, retained by locking ring at each end. Pin hole in piston offset toward camshaft.
Pin Fit in Piston—Light push fit (piston at 200° F.).
Pin Fit in Rod Bushing—Select pin for .0001" clearance or light push fit at normal temperature.
Replacement Pins:—Standard, .001" .003" oversize.

CONNECTING ROD:—**Length**—8¾". **Weight**—36¼ ozs.
Upper Bearing (Piston Pin Bushing)—Bronze.
Crankpin Journal Diameter—2.002". *See Engine Code Note in Nash Shop Notes for original bearing sizes.*
Lower Bearing—Removable, steel-backed babbitt.
Clearance—.0015-.0025". **Sideplay**—.008-.012".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or bearing caps. *See Nash Shop Notes for instructions and 'Palnut' data.*
Replacement Bearings:—Std. & .002", .010" undersize.
Installing Rods:—Mark rods and bearing caps before removal and install in same position. Oil hole in lower end of rod must be toward right of engine.

CRANKSHAFT:—7 bearing, counterweighted type.
See Nash Shop Notes for Vibration Dampener data.
Journal Diameters—2 31/64" all bearings. *See Engine Code Note in Nash Shop Notes for original bearing sizes.*
Bearings—Removable steel-backed, babbitt type.
Clearance—.002-.003".
Bearing Adjustment:—None (no shims). Replace bearings. *See Nash Shop Notes for bearing installation and fitting, replacement main bearing caps, and rear main bearing oil seal data.*
Replacement Bearings:—Std. & .002", .010" undersize.
End Thrust:—Taken by center bearing. Replace bearing to take up excessive endplay. **Endplay** .004-.006".

CAMSHAFT:—Non-adjustable roller-chain drive.
See Nash Shop Notes for Camshaft Removal directions.
Bearing Type—Steel-backed, babbitt bushings.
Clearance—.002".
End Thrust:—Taken by front bearing.
Endplay—.004-.006".
Timing Chain:—Whitney No. 49205 roller chain. Width 9/16". Pitch ⅜". Length 22½" or 60 links.
Camshaft Setting:—Mesh chain with marks on camshaft and crankshaft sprockets adjacent and in line with straightedge across shaft centers. With camshaft turned so that sprocket mark is 45° past (to right) of top vertical position, there should be 9½ links between sprocket marks.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1¾"	.3725"	5 17/32"
Exhaust	1 19/32"	.3725"	5 17/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	11/32"	.002-.004"

Tappet Clearance:—.015" all valves, engine hot and idling (.018" max. may be used for sustained high speed driving. CAUTION—Oil plug in drilled passage in cylinder head (between oil filter pipe and lead to rocker arm shaft) must be removed to cut off oil to rocker arm shafts when valves adjusted with engine running. IMPORTANT—Plug must be replaced after adjustment completed (oil is bypassed in head with plug out and valve mechanism will not be oiled).
Valve Guides:—Press fit in head (positioned by shoulder on guide). Ream new guides for clearance.
Valve Springs:—Double springs used on all valves. Free length 1 21/32" (inner), 2" (outer spring).

	Inner Spring Pressure	Inner Spring Length	Outer Spring Pressure	Outer Spring Length
Valve Closed	21 lbs.	1 3/8"	38 lbs.	1 11/16"
Valve Open	51 lbs.	1 1/32"	95 lbs.	1 11/32"

Valve Lifters:—Mushroom type. Lifter guide holes in block. Remove from below with camshaft out.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 11.6° ATDC. Close 34.6° ALDC.
Exhaust Valves—Open 49.3° BLDC. Close 5° ATDC.
To Check Valve Timing—With .015" tappet clearance, #1 intake valve opens 11.6° ATDC. with 'DC' mark on vibration dampener at front of engine 23/32" after the indicator on the chain case cover. Exhaust valve closes with piston 5° or .0104" ATDC.

LUBRICATION:—Pressure system with gear type oil pump in crankcase (pump driven by separate gear from camshaft with oil delivery up along drive shaft to oil gallery in engine block).
Normal Oil Pressure:—25-30 lbs. at 25 MPH (warm oil).
Oil Pressure Regulator:—On oil pump cover. Opens at 30 lbs. Not adjustable.
Crankcase Capacity:—6 quarts.

COOLING SYSTEM:—**Capacity** 17 qts. (18 with heater).
Water Pump:—Centrifugal, adjustable packing type.
For complete data, refer to 1941 Mech. Equip. Index.
Removal—Drain radiator, disconnect hose and drive coupling, take out mounting screws in pump flange.
Thermostat:—Fulton or Dole. In cyl. head outlet.
Setting—Starts to open at 160°F.
Temperature Gauge:—Auto-Lite (Motometer) Vapor Tension type. Auto-Lite No. H-9644.
For complete data, refer to 1941 Mech. Equip. Index.

CLUTCH:—**Borg & Beck Model 10A7. Assembly No. 950.** Single plate, dry disc type.
For complete data, refer to 1941 Mech. Equip. Index.
Facings—Moulded-woven type, 2 used. Inside Diam. 7". Outside Diam. 10". Thickness ⅛".
Pedal Adjustment & Over-center Spring Setting:—Pedal free travel ½-1". Adjusted in same manner as on the Nash 8 (see next page for instructions). CAUTION—Over-center spring setting must be checked whenever clutch pedal is adjusted.
Removal:—Remove Transmission (see below). Disconnect clutch pedal linkage, support engine at rear and free rear engine mountings, remove clutch housing and pan. Punchmark flywheel, clutch cover and pressure plate (reassemble to same marks), remove clutch mounting screws and clutch.

TRANSMISSION:—**Own Make.** New design, all helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse).
For complete data, refer to 1941 Mech. Equip. Index.
Overdrive (Cruising Gear):—Warner Model AS1-R7C, Type R7C with electrical 'kick-down' control.
For complete data, refer to 1941 Mech. Equip. Index.
Transmission Control:—Mech. steering column shift.
For complete data, refer to 1941 Mech. Equip. Index.
Removal:—Disconnect shift rods, speedometer cable, overdrive control cable & wires (if used), and driveshaft. Remove two right transmission mounting studs and install pilot studs (to support transmission during removal), remove other mounting stud nuts, pull transmission straight back and remove

UNIVERSAL JOINTS:—**Mechanics Type 2CR.** New type roller bearing joint. Two used.
For complete data, refer to 1941 Mech. Equip. Index.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—4.1-1 Std., 4.4-1 with Overdrive.
Backlash—.005-.007". Shim adjustment.
Removal:—Hoist rear end of car, disconnect shock absorbers, remove axle shafts (see below), free axle from springs by disconnecting U bolts and rear shackles, withdraw axle assembly from beneath car.
Axle Shaft Removal:—Remove wheel and drum, disconnect brake line and cable, remove backing plate mounting bolt nuts, oil seal retainer, backing plate, and bearing adjusting shims. Withdraw shaft and bearing, using care not to drag shaft on oil seal.
Wheel Bearing Adjustment—Shims located between backing plate and flanged end of housing. To adjust, remove wheel and backing plate (above), add or remove shims for endplay. **Endplay** .003-.006".

SHOCK ABSORBERS:—**Delco Model 1016-E (front), 1023-BB (rear).** Direct acting, hydraulic type.
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—**Steering Gear**—Gemmer Model 305. Worm-and-Roller type with 'push-pull' adjustment.
For complete data, refer to 1941 Mech. Equip. Index.
Front Suspension:—Independent, linked parallelogram type with coil springs.
For complete data, refer to 1941 Mech. Equip. Index.
Kingpin Inclination—4½° crosswise.
Caster—0° to ½° Neg. Adjustable.
Camber—Pos. ¼° to ½°. Adjustable.
Toe In—1/32-3/32" measured 10" up from floor. Adjustable by loosening clamp bolts and turning adjusting tube at outer end of each tie rod equally.
Steering Geometry (Toe out on turns)—Inner wheel turned 21° plus ¾°, outer wheel exactly 20°.

BRAKES:—**Service**—Bendix hydraulic, duo-servo, single anchor type, without Eccentric Adjustment. Hand lever applies rear wheel service brakes.
For complete data, refer to 1941 Mech. Equip. Index.
Drums—Cast iron. Diameter 10".
Lining—Moulded type. Width 2." Thickness 3/16". Length 22" per wheel.
Clearance—.015" at each end of secondary shoes with primary shoes forced out against drum.
Braking Power—53% front, 47% rear wheels.
Hand Brakes:—See Service Brake above.

HOOD LOCK & ENGINE CODE (BORE & BEARING SIZES) NOTES:—*See Nash Shop Notes for data.*

SERIAL NUMBER:—First No. B-110001. On plate on right frame siderail under engine hood.
Service Serial Number—First No. N8-17001. Stamped on left front door pillar post.

ENGINE NUMBER:—First No. B-110001 (same as Serial No.). On right side of cylinder block at front end.

ENGINE SPECIFICATIONS:—8 cylinder, valve-in-head, Twin Ignition type with Iso-thermal fuel intake system (intake manifold cast in cylinder head—water jacketed for temperature control).
Bore—3⅛". **Stroke**—4¼".
Displacement—260.8 cu. ins. **Rated HP**—31.25.
Developed Horsepower—115 at 3400 RPM.
Compression Ratio—6.3-1 Std. cast iron head.
Compression Pressure—110 lbs. at 350 RPM.
Vacuum Reading—Steady 18-20" idling at 7-8 MPH.

PISTONS:—Nelson Bohnalite, aluminum alloy, Invar strut, tin-plated, split skirt type.
Weight—16 ozs. (stripped). **Length**—3 11/16".
Removal—Pistons and rods removed from below.
Clearance—See Fitting New Pistons.
Original Bore Sizes:—*See Engine Code Note in Nash Shop Notes for data.*
Replacement Pistons:—Furnished std. and .001", .002", .003", .005", 010", .012", .015", .020", .040" oversize.
Fitting New Pistons:—Use .0025" dry (not oiled) feeler between piston and wall on side opposite slot at right angles to pin hole. Pull to withdraw feeler 8-15 lbs. with piston at room temperature.
Installing Pistons:—Pin offet toward camshaft. Slot toward left (trademark in piston toward front).

PISTON RINGS:—Two compression, two oil control rings per piston, all above pin. Oil ring grooves drilled for oil drainage.

Ring	Width	End Gap	Side Clearance
Compr. (both)	.124"	.010-.015"	.002-.004"
Oil Cont. (Upper)	.124"	.010-.015"	.002-.004"
Oil Cont. (Lower)	.1865"	.010-.015"	.002-.004"

Replacement Rings:—*See Nash Shop Notes for data.*

PISTON PIN:—**Diameter**—.8747". **Length**—2.574". Floating type, retained by locking ring at each end. Pin hole in piston offset toward camshaft.
Pin Fit in Piston—Light push fit (piston at 200°F).
Pin Fit in Rod Bushing—Select pin for .0001" clearance or light push fit at normal temperature.
Replacement Pins:—Std., .001", .003", .005" oversize.

CONNECTING ROD:—**Length**—8¾". **Weight**—34 ozs.
Upper Bearing (Piston Pin Bushing)—Bronze.
Crankpin Journal Diameter—2.002". *See Engine Code Note in Nash Shop Notes for original bearing sizes.*
Lower Bearing—Removable steel-backed, babbitt.
Clearance—.0015-.0025". **Sideplay**—.008-.012".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or bearing caps. *See Nash Shop Notes for instructions and 'Palnut' data.*
Replacement Bearings:—Std. & .002", .010" undersize.
Installing Rods:—Mark rods and bearing caps before removal and install in same positions. Oil hole in lower end of rod must be toward right of engine.

CRANKSHAFT:—Nine bearing. No counterweights.
See Nash Shop Notes for Vibration Dampener data.
Journal Diameters—2 31/64" all bearings. *See Engine Code in Nash Shop Notes for original bearing sizes.*
Bearings—Removable steel-backed, babbitt type.
Clearance—.002-.003".
Bearing Adjustment:—None (no shims). Replace bearings. *See Nash Shop Notes for bearing installation and fitting, replacement main bearing caps, and rear main bearing oil seal data.*
Replacement Bearings:—Std. & .002", .010" undersize.
End Thrust:—Center (#5) bearing. Replace bearing to take up excessive endplay. **Endplay**—.004-.006."

CAMSHAFT:—Non-adjustable roller chain drive.
See Nash Shop Notes for Camshaft Removal directions.
Bearings—Steel-backed, babbitt bushings.
Clearance—.002".
End Thrust:—Taken by front bearing. **Endplay** .004-.006".
Timing Chain:—Diamond double roller type. Width 9/16". Pitch ⅜". Length 23¼" or 62 links.
Camshaft Setting:—Mesh chain with marks on sprockets adjacent and in line with straightedge across shaft centers. With camshaft turned so that sprocket mark is 45° past (to right) of top vertical position, there should be 10 links between sprocket marks.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	.3725"	5½"
Exhaust	1 15/32"	.3725"	5½"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	11/32"	.002-.004"

Tappet Clearance:—.015" all valves, engine hot and idling. NOTE—.018" maximum may be used for sustained high speed driving.
Valve Guides:—Press fit in head (positioned by shoulder on guide). Ream new guides for correct clearance.
Valve Springs:—Double springs used on all valves. Free length 1 21/32" (inner), 2" (outer spring).

	Inner Spring Pressure	Inner Spring Length	Outer Spring Pressure	Outer Spring Length
Valve Closed	21 lbs.	1 3/8"	38 lbs.	1 11/16"
Valve Open	51 lbs.	1 1/32"	95 lbs.	1 11/32"

Valve Lifters:—Mushroom type. Lifter guide holes reamed in block. Remove from below (camshaft out).
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 16° ATDC. Close 38° ALDC.
Exhaust Valves—Open 45° BLDC. Close 10° ATDC.
To Check Valve Timing—With .015" tappet clearance, #1 intake valve opens 16° ATDC with 'DC' mark on vibration dampener at front of engine 1 5/16" after the indicator on the chain case cover. Exhaust valve closes with piston 10° or .0400" ATDC.

LUBRICATION:—Pressure system. Gear type oil pump in crankcase. NOTE—When pump installed, slot in shaft should be across engine with #1 piston in firing position.
Normal Oil Pressure:—25-30 lbs. at 25 MPH (warm oil).
Oil Pressure Regulator:—On oil pump cover. Opens at 30 lbs. Not adjustable.
Crankcase Capacity:—7 quarts.

COOLING SYSTEM:—**Capacity** 16 qts. (17 with heater).
Water Pump:—Centrifugal, adjustable packing type.
For complete data, refer to 1941 Mech. Equip. Index.
Removal—Drain radiator, disconnect hose and drive coupling, take out mounting screws in pump flange.
Thermostat:—Fulton or Dole. In cyl. head outlet.
Setting—Starts to open at 160°F.
Temperature Gauge:—Auto-Lite (Motometer) Vapor Tension type. Auto-Lite No. H-9644.
For complete data, refer to 1941 Mech. Equip. Index.

CLUTCH:—**Borg & Beck Model 10A7. Assembly No. 950.** Single plate, dry disc type.
For complete data, refer to 1941 Mech. Equip. Index.
Facings—Moulded-woven type, 2 used. Inside Diam. 7". Outside Diam. 10". Thickness ⅛".
Pedal Adjustment:—Pedal free travel ½-1". To adjust, loosen one nut and tighten opposite nut on connector link at throw-out shaft lever. Both nuts must be tightened securely and locked with 'Palnuts'.
Over-center Spring Adjustment—Check when clutch pedal adjusted. Loosen nut in lever on end of clutch throw-out shaft, position lever so that spring hole in lever not more than ⅛" above line from lever screw hole to other spring hole in engine bracket.
Removal:—Remove Transmission (see below). Disconnect clutch pedal linkage, support engine at rear and free rear engine mountings, remove clutch housing and pan. Punchmark flywheel, clutch cover and pressure plate (reassemble to same marks), remove clutch mounting screws and clutch.

TRANSMISSION:—**Own Make.** New design, all helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse).
For complete data, refer to 1941 Mech. Equip. Index.
Overdrive (Cruising Gear):—Warner Model AS1-R7C, Type R7C with electrical 'kick-down' control.
For complete data, refer to 1941 Mech. Equip. Index.
Transmission Control:—Mech. steering column shift.
For complete data, refer to 1941 Mech. Equip. Index.
Removal:—Disconnect shift rods, speedometer cable, overdrive control cable & wires (if used), and driveshaft. Remove two right transmission mounting studs and install pilot studs (to support transmission during removal), remove other mounting stud nuts, pull transmission straight back and remove

UNIVERSAL JOINTS:—**Mechanics Type 3CR.** New type roller bearing joint. Two used.
For complete data, refer to 1941 Mech. Equip. Index.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—4.1-1 Std., 4.4-1 with Overdrive.
Backlash—.005-.007". Shim adjustment.
Removal:—Hoist rear end of car, disconnect shock absorbers, remove axle shafts (see below), free axle from springs by disconnecting U bolts and rear shackles, withdraw axle assembly from beneath car.
Axle Shaft Removal:—Remove wheel and drum, disconnect brake line and cable, remove backing plate mounting bolt nuts, oil seal retainer, backing plate, and bearing adjusting shims. Withdraw shaft and bearing, using care not to drag shaft on oil seal.
Wheel Bearing Adjustment—Shims located between backing plate and flanged end of housing. To adjust, remove wheel and backing plate (above), add or remove shims for endplay. **Endplay** .003-.006"

SHOCK ABSORBERS:—**Delco Model 1016-E (front), 1023-BB (rear).** Direct acting, hydraulic type.
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—**Steering Gear**—Gemmer Model 335. Worm-and-Roller type with 'push-pull' adjustment.
For complete data, refer to 1941 Mech. Equip. Index.
Front Suspension:—Independent, linked parallelogram type with coil springs.
For complete data, refer to 1941 Mech. Equip. Index.
Kingpin Inclination—4½° crosswise.
Caster—0° to ½° Neg. Adjustable.
Camber—Pos. ¼° to ½°. Adjustable.
Toe In—1/32"-3/32" measured 10" up from floor. Adjustable by loosening clamp bolts and turning adjusting tube at outer end of each tie rod equally.
Steering Geometry (Toe out on turns)—Inner wheel turned 21° plus ¾°, outer wheel exactly 20°.

BRAKES:—**Service**—Bendix hydraulic, duo-servo, single anchor type, without Eccentric Adjustment. Hand lever applies rear wheel service brakes.
For complete data, refer to 1941 Mech. Equip. Index.
Drums—Cast iron. Diameter 10".
Lining—Moulded type. Width 2." Thickness 3/16". Length 22" per wheel.
Clearance—.015" at each end of secondary shoes with primary shoes forced out against drum.
Braking Power—53% front, 47% rear wheels.
Hand Brakes:—See Service Brake above.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

HOOD LOCK:—Hood lock controlled by 'Push-Pull' control knob to left of steering column on lower flange of instrument panel. To raise hood, pull control knob out to release hood latch (hood will raise 1½"), press up on tab of 'Safety Hook' under center of hood at front.

HOOD REMOVAL:—Hood panel can be removed as follows: Remove hood hinge-to-cowl bolts (mark hinge location on cowl to facilitate installation). Remove hood hinge brace-to-tie bar bolts, lift off hood.

Hood Alignment—Hood to dash clearance should be 3/16". This clearance must be even across rear edge of hood. Hood can be adjusted as follows: Hood can be adjusted for up and down and forward movement by means of enlarged holes in cowl at hood hinges. Hood fit along top of grille and fenders adjustable by moving rubber bumpers on hood at each side of aligning bolt at front end up or down. Aligning bolt can also be adjusted. Adjustable support in middle of tie bar between hood hinges should be adjusted to contact hood panel with tension, but not enough tension to move panel away from cowl. Prevents hood distortion (does not affect hood fit).

FRONT END SHEET METAL ASSEMBLY REMOVAL:—Front fender, radiator grille, and radiator core can be removed as an assembly without removing hood as follows: Drain cooling system. Disconnect radiator upper and lower hoses, headlight wires and wiring harness at junction block, horn, and hood latch operating cable from latch plate at radiator grille. Remove cowl kick pads from inside car and remove 4 fender-to-cowl bolts (3 at rear edge of fender, 1 at cowl just to rear of hood hinge). Disconnect radiator brace rods at cowl. Jack up front end of car. Remove 2 fender-to-rocker panel bolts (at lower rear corner of fender) and 3 fender-to-frame bolts behind fender skirt (below front edge of engine dash). Remove bumper primary bar from secondary bar and nut and washer from radiator support-to-frame front cross-member bolt (on underside of cross-member). Free snap-in fasteners from splash guard at front cross-member. Move front end assembly forward (center bolt hole in support plate slotted) and remove from car.

Alignment—When assembly installed, adjust fender to door clearance as described below. Check hood fit (see Hood Alignment above).

Front Fender Alignment—When fender installed on car, it must be properly aligned and clearance at door must be adjusted as follows: Fender bolt holes at cowl and body are enlarged to permit fitting fender. Install fender bolts just tight enough to allow shifting fender for alignment. Fit fender to door in such a manner as to just allow door to open. Gap between rear edge of fender and door should be ⅛" plus 1/32" minus 0" and be equal for both sides of car. After fender fitted, tighten bolts.

CYLINDER HEAD SERVICING:—Steel-asbestos cylinder head gasket used. **This gasket cannot be reused.** When installing new gasket, coat both sides with thin coat of P.O.B. Perfect Gasket Seal with room temperature of approximately 70° F. (edges at cylinder bore holes must be wiped clean of all sealer). Install gasket with 3/16" flange next to cylinder block (flange on upper side 3/32" wide). To prevent leakage, plain washers are used under cylinder head bolt heads. Use Torque Wrench (Tool J-1264) and tighten bolts to 60-70 lbs. ft. tension. ***See Cylinder Head Tightening Diagram in 1941 Mechanical Equipment Section for tightening order.***

8 Cylinder Engine Note—Install new neoprene grommet in pump by-pass hole on front of head.

OIL PAN REMOVAL:—Oil pan can be removed as follows: Disconnect idler arm support from frame and drop steering relay rod assembly. Remove flywheel lower pan on 8 cylinder engines only. Remove pan bolts. For access to bolts at front end of pan, unhook fasteners of splash guard between radiator lower baffle and frame cross-member and work through openings in front cross-member. Turn crankshaft to place counterweights up out of the way, remove one or the other of the engine filler plates if necessary, take off pan.

Installation—Use new gaskets and permit them to dry before installing pan so that gaskets will not be disturbed when pan installed on engine.

PISTON PINS:—**Servicing**—Standard size pins only furnished for service. Pin bosses in pistons electrolited and must not be reamed. Replacement pistons (standard and oversize) furnished with pins fitted.

Removal:—To remove pin, take out lockscrew, place assembly in boiling water for one minute. With Tool HM-535 push pin out through plain boss end.

Fitting:—Pin fit in piston .0001" loose to .0002" tight (plain boss), .0002-.0005" tight (lock screw boss). Pin fit in rod bushing .0003-.0006". If rod bushing worn, press new bushing in place (align oil hole in bushing and rod), burnish with Tool HM-587E and line ream with Reamer HM-586 to .8558-.8562".

Installing:—To install pin, heat piston and pin (as for Removal above), dip pin in hot light engine oil, start pin through plain boss end of piston and through rod (make sure lock screw hole in pin and boss will be aligned), then with Tool HM-535 lightly push pin in place until hole in pin and boss aligned (use punch in hole to correct slight mis-alignment). IMPORTANT—Pin must not be forced (if heavy push required, indicates piston has cooled, disassemble and reheat piston and pin). After pin in place, coat lock screw with graphite and tighten to 9-11 lbs. ft. tension with a torque wrench.

MAIN BEARING UPPER HALVES:—**Removal**—May be removed without removing crankshaft by removing bearing cap and inserting pin (Tool HM-J-173) in oil hole in shaft. With tang on pin engaging plain end of bearing shell, rotate shaft in usual direction and turn shell out.

Installation—Remove sharp edge from plain end of bearing, insert this end at indented side of support and rotate in place using pin in oil hole in shaft.

CRANKSHAFT END THRUST:—Taken through front (#1) main bearing. Two bronze thrust plates doweled to bearing cap, one to front face of cap and one to rear face. A steel thrust collar is assembled between front bronze plate & crankshaft sprocket.

Hydra-Matic Cars—Steel thrust collar (Part No. 414229) has a more highly polished finish than that used on synchro-mesh transmission equipped cars. Can be identified by finish and part no. which is etched on collar. This collar only furnished for service (can be used to service synchro-mesh transmission equipped cars also). Front bronze thrust washer has eight grooves in face of plate and must be assembled with these grooves next to steel thrust collar. A plain bronze thrust washer is used at rear.

REAR MAIN BEARING OIL SEAL:—Consists of oil slinger on crankshaft to rear of bearing with asbestos covered wiper seal in groove in bearing support and bearing cap. Cork strips used to seal vertical joints between bearing support and cap.

Installation—With crankshaft out of engine and bearing cap and shells off, crowd seal in rear groove of bearing support by hand. Use seal compressor Tool J-955 over seal and tap tool 3 or 4 times to seat seal. With tool resting on seal, cut ends flush at each end. Repeat operation for bearing cap. Seal must entirely fill groove and be trimmed flush to prevent oil leaks. Install cork seals in vertical grooves when installing cap.

CAMSHAFT END THRUST:—Forward thrust now taken by semi-circular flange around camshaft opening in front engine support plate. Backward thrust taken by flange ahead of front camshaft bearing journal and front face of cylinder block (same as 1940). IMPORTANT NOTE—Camshaft on 1941 Engines recessed at front end for spring-loaded thrust button (formerly used to take forward thrust). Spring-loaded button should not be assembled to camshaft on 1941 engines (see above). 1941 timing chain cover equipped with camshaft thrust plate so that this cover may be used in service for earlier cars. Thrust plate does not function on 1941 engines.

OIL PUMP:—Gear type pump. Six and Eight pump identical except for gear faces which are ¼" wider on Eight. When assembling pump gear on shaft, press shaft on gear flush with outer end of gear (Six), with gear extending ¼" beyond end of shaft (Eight—Use Tool J-954 which properly positions gear on shaft). Pump drive gear must be assembled with Feeler Gauge J-954-1 between inner face of gear hub and pump body to give proper end clearance for pump shaft. Use new pump body gasket.

Installation—Set engine in firing position for #1 cylinder with rotor opposite #1 segment in distributor cap. Note position of distributor shaft tongue for proper oil pump drive gear mesh, then raise distributor and mesh pump drive gear with camshaft gear. Replace distributor in position and reset ignition timing.

RADIATOR CORE REMOVAL:—Radiator core can be removed as follows: Raise hood. Disconnect hood latch operating cable at latch, pull cable back free of core support flange. Remove 4 radiator core-to-lower support bolts at each side. Core on Six cylinder engines can then be removed by rotating fan as required while lifting core out of car. On Eight cylinder engines, remove 2 upper core support (U-shaped channel behind core)-to-fender and lower support bolts at each side. Core can then be removed by rotating upper support toward engine as required, turning fan as necessary, and lifting out.

CLUTCH HOUSING REINFORCING PLATE:—Used on all 8 cylinder cars with conventional transmission. Consists of 3/16" steel plate bolted between clutch housing and underpan (replaces conventional gasket). Plate is secured to housing by 2 screws. 12 screws used to bolt underpan (through plate) to housing. Coat both sides of plate with Permatex.

1940 & PREVIOUS MODELS

CLUTCH RELEASE BEARING:—**Production Change**—Beginning with Engine No. G-190392 (6 Cyl.), L-365742 (8 Cyl.), new type release bearing which has pressure gun fitting used so that bearing can be lubricated in service. Fitting extends down at angle toward left side and is accessible by removing lower clutch cover pan. Lubricate once each year (or at 5000 mile intervals for extreme service) using petrolatum only (heavy grease will not penetrate carbon release bearing).

IMPORTANT REPLACEMENT NOTE—This new type bearing with grease fitting can be installed on early 1940 cars and 1939 models to correct complaints of dry or noisy release bearings.

HOOD LOCK, FRONT END SHEET METAL ASSEMBLY & OIL PAN REMOVAL:—*See Oldsmobile Shop Notes.*

MODEL NOTATION	Model	Series
Special Six	F-41	66
Dynamic Cruiser Six	G-41	76
Custom Cruiser Six	H-41	96

SERIAL NUMBER:—On plate on upper left corner of engine dash. 1st nos.:

	66	76	96
Lansing	66-1001	76-1001	96-1001
California	66C1001	76C1001	96C1001
Linden, N. J.	66L1001	76L1001	96L1001

ENGINE NUMBER:—First number G225001 (LHD cars). On top left side of engine back of water pump.
Hydra-matic Drive Cars—Carry no. prefix 'GA'.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head.
Bore—3½". **Stroke**—4⅛".
Displacement—238.1 cu. ins. **Rated HP**—29.4.
Developed Horsepower—100 at 3400 RPM (Std. hd.).
Compression Ratio—6.1-1 Std., 5.74-1 Export.
Compression Pressure—115 lbs. ± 10 lbs. at cranking speed of 100 RPM (Std. head).
Vacuum Reading—Steady 17" min. at idling speed.
See Oldsmobile Shop Notes for Cylinder Head Servicing.

PISTONS:—Aluminum alloy, T-slot, cam ground type with electro-hardened oxide bearing surface.
Weight—17.37 ozs. (stripped). **Length**—4 1/32".
Removal—Pistons and rods removed from above.
Clearance—Top .023-.028". Skirt .0005-.0010".
NOTE—Piston skirt taper inward from bottom to top should be .0015-.002". Differs from Eight.
Replacement Pistons:—Finished pistons (pins fitted) .003", .005", .010", .015", .030" oversize. Same wt. as std.
Fitting New Pistons:—Check piston for size with micrometers (pin removed) 90° from pin bosses ⅜" below lower ring groove and ⅜" from bottom of skirt. Insert .002" x ½" feeler between piston (pin removed) and cylinder wall on valve side with piston inverted and T-slot on opposite side from feeler. Pull to withdraw feeler must be 4 to 11 lbs. (piston and block at 70°—low limit below 70°, high above).
Installing pistons:—Mark 'V-S' on head toward valves (slot away from valves). Pin hole offset 3/32".

PISTON RINGS:—2 compression (coated type—install with mark TOP up), 2 oil control, all above pin.

Ring	Width	End Gap	Side Clearance
Compr.	.0925-.0935"	.008-.018"	.001-.003"
Oil Contr.	.1860-.1865"	.007-.015"	.001-.0025"

Replacement Rings:—.010", .020", .030" oversize.

PISTON PIN:—**Diameter**—.8554-.8557". **Length**—3 5/32". Pin locked in one piston boss by lockscrew (opposite end slotted). Pin bosses are plated and must not be reamed. Standard size pins only serviced.
Pin Fit in Piston—.0001" loose to .0002" tight (plain boss end), .0002-.0005" tight (lock boss end).
Pin Fit in Rod Bushing—.0003-.0006" clearance.
See Oldsmobile Shop Notes for Pin Fitting directions.

CONNECTING ROD:—**Length**—7 13/16". **Weight**—28.0 ounces (complete except for bearing inserts).
NOTE—Six and Eight rods not interchangeable.
Crankpin Journal Diameter—2.123-2.124".
Lower Bearing—Removable steel-backed, babbitt. **Clearance**—.0005-.0025". **Sideplay**—.0055-.0105".
Bearing Adjustment:—None. Replace bearings.
Installing Rods:—Oil spit hole at lower end toward valves and grooves on rod and cap bolt boss (part number side) matched. Special ground cap bolts with self-locking nuts used and should be tightened with torque wrench to 50-55 lbs. ft. tension.

CRANKSHAFT:—4 bearings, integral counterweights.
Journal Diameters—#1, 2.478-2.479"; #2, 2.5405-2.5415"; #3, 2.6655-2.6665"; #4, 2.6855-2.6865".
Bearings—Removable, steel-backed, babbitt. Upper and lower halves interchangeable except #1 (front) which has additional short oil groove to front.
Clearance—.0005-.002" (rear), .001-.003" (all others).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file caps. **Endplay**—.004-.008".
NOTE—9/16" cap bolts on rear bearing, ½" others.
See Oldsmobile Shop Notes for Main Bearing Removal, Crankshaft End Thrust and Oil Seal data.

CAMSHAFT:—4 bearing. Non-adjustable chain drive.
Journal Diameters—#1, 1.9970-1.9975"; #2, 1.9345-1.9350"; #3, 1.8720-1.8725"; #4, 1.8095-1.8100".
Bearings—Bronze bushings. **Clearance** .0015-.0035".
End Thrust:—Forward end thrust now taken by front engine support plate. *See Oldsmobile Shop Notes.*
Timing Chain:—Whitney No. 411239. Width 1". Pitch .500" (½"). Length 47 links or 23½".
Camshaft Setting:—Mesh chain with sprocket marks adjacent and in line with a straightedge across the shaft centers (or use Tool HM-408-0).

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	.3415-.3425"	5 51/64"
Exhaust	1 27/64"	.3410-.3418"	5 51/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.303"	.00175-.00375"
Exhaust	45°	.298"	.00245-.00425"

Tappet Clearance:—.008" Int., .011" Exh. Hot & idling.
NOTE—Self-locking tappet screws used. Remove right fender filler plate for access to valves.
Valve Guides:—Intake and exhaust guides same. Press guides in so top end ⅞" below top of block. (Tool J-1042 positions guide correctly in block). Ream to .34425-.34525" inside diam. (not tapered).

Valve Springs:—	Spring Pressure	Spring Length
Valve Closed	50½ lbs.	2¼"
Valve Open	95½ lbs.	1 15/16"

Valve Lifters:—Mushroom type (same on 6 & 8). Holes reamed in block have bearing-ized finish (if worn, fit oversize lifter without reaming hole) Body Diam. .6235-.6240". Furn .001", .002", .005", .010", OS. **Clearance**—.0005-.0008". NOTE— 1⅛" diameter face lifter only should be used on 1941 models.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 5° BTDC. Close 45° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
Valve Timing Check—With .0124" tappet clearance, #1 intake valve should open with piston 5° (.0163") BTDC with flywheel TDC mark (steel ball insert) approx. 2 teeth before indicator (hole on left front face of housing). Reset tappet clearance at .008" hot.

LUBRICATION:—Pressure (gear type pump on right of engine). *See Oldsmobile Shop Notes for Oil Pump data.*
Normal Oil Pressure:—28-33 lbs.
Oil Pressure Regulator:—On pump, opens at 30 lbs. Non-adjustable type.
Crankcase Capacity:—5 quarts.

COOLING SYSTEM:—**Capacity**—17¾ quarts.
See Oldsmobile Shop Notes for Radiator Core Removal.
Water Pump:—Packless, sealed ball-bearing type.
For complete data, refer to 1941 Mech. Equip. Index.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Starts to open 152°F. Fully open 173°F.
Temperature Gauge:—AC Electric #1511043 (dash), #1510772 (engine unit). *Refer to Mech. Equip. Index.*

CLUTCH (STD. TRANS.):—**Borg & Beck Model 9A7 with 'Borglite' driven member.** Marked #924 on cover. Single plate, dry disc type with steel and asbestos composition pressure plate oil baffle and clutch release bearing lubrication fitting.
For complete data, refer to 1941 Mech. Equip. Index.
Facings—Spiral wound (spirally grooved) molded woven, 2 used. Inside Diam. 6", O.D. 9¼". ⅛" thick.
Pedal Adjustment:—Free travel 1-1½". Turn link at fork in or out of clevis on auxiliary shaft.
Removal:—Remove transmission (see data below), clutch underpan and take out 6 mounting screws in clutch cover (when installing, use 2 long shank mounting screws in 2nd hole on each side of locating dowel), lower clutch assembly out.

TRANSMISSION (STD.):—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote shift.
For complete data, refer to 1941 Mech. Equip. Index.
Transmission Control:—Oldsmobile 'Handi-shift' type.
For complete data, refer to 1941 Mech. Equip. Index.
Removal:—Disconnect shift and selector rods from levers at transmission, speedometer cable, rear universal and slide slip yoke and propeller shaft to rear. Remove four transmission mounting capscrews, pull transmission straight back and remove.

HYDRA-MATIC DRIVE (OPTL.):—**Own Make**—Consists of fluid coupling & automatic transmission.
For complete data, refer to 1941 Mech. Equip. Index.

UNIVERSAL JOINTS:—**Mechanics 2C or 2CR (new type).** Roller bearing types. Two used.
For complete data, refer to 1941 Mech. Equip. Index.
NOTE—Slip joint formed at rear of transmission ahead of front U-joint (driveshaft 1 piece type).

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with torque taken through 2 support arms.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—**4.1-1** Std. 66. **4.3-1** Std. 76 & 96, Mountain ratio 66. **3.42-1** Hydra-Matic 66. **3.63-1** Hydra-Matic 76 & 96. **4.55-1** Mountain 76 & 96. **3.9-1** Plains ratio.
NOTE—Ring and pinion gear ratio (41-10, etc.) stamped on top side of differential carrier.
Backlash—.004-.008". Screw adjustment.
Removal:—Disconnect drive shaft at rear universal (do not disengage spline joint at transmission), remove axle shafts and carrier flange capscrews.
Axle Shaft Removal:—Hoist rear end, remove wheel, brake drum, backing plate mounting nuts, static collector and loosen bearing retainer (do not move backing plate or brake line may be damaged). Pull shaft and bearing with puller J-942 (do not allow shaft to drag on oil seal), replace 1 backing plate nut.
Wheel Bearing Adjustment—None.
Rear Suspension:—Quadri-coil type (support arms).
For complete data, refer to 1941 Mech. Equip. Index.

SHOCK ABSORBERS:—**Delco.** FRONT—Model 1947-C (right), D (left). RIGHT REAR—2105-E (76, 96), G (66). LEFT REAR—2105-F (76, 96), H (66). Double acting (parallel cylinder type rear), hydraulic.
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—**Steering Gear**—Saginaw Worm-and-Roller type. *For data, refer to Mech. Equip. Index.*
Front Suspension:—Independent, linked parallelogram type with coil springs.
For complete data, refer to 1941 Mech. Equip. Index.
Kingpin Inclination—4°51'10".
Caster—0-¾° Negative. Adjustable.
Camber—Negative ¼° to Positive ¾°. Adjustable.
Toe In—1/16-⅛". Adjust each tie rod equally.
Steering Geometry—Inner wh'l 23° ± ½°. Outer 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
For complete data, refer to 1941 Mech. Equip. Index.
Wheel Cylinder Bore—Front wheel 1 3/32". Rear 1".
Drums—Cast-iron. Diameter 11".
Lining—Molded. Width 1¾" (66), 2" (76, 96). Thickness 3/16". Length per shoe 9 11/32" (primary), 11 31/32" (secondary shoe).
Clearance—.015" at both ends of secondary shoe with primary shoe forced out against drum.
Hand Brake:—See Service Brakes above.

HOOD LOCK, FRONT END SHEET METAL ASSEMBLY & OIL PAN REMOVAL:—*See Oldsmobile Shop Notes.*

MODEL NOTATION:—

	Model	Series
Special Eight	E-41	68
Dynamic Cruiser 8	J-41	78
Custom Cruiser 8	L-41	98

SERIAL NUMBER:—On plate on upper left corner of engine dash. 1st nos.:

	68	78	98
Lansing	68-1001	78-1001	98-1001
California	68C1001	78C1001	98C1001
Linden, N. J.	68L1001	78L1001	98L1001

ENGINE NUMBER:—First number L379001 (LHD cars). On top left side of engine back of water pump. **Hydra-matic Drive Cars**—Carry no. prefix 'LA'.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head. **Bore**—3¼". **Stroke**—3⅞". **Displacement**—257.1 cu. ins. **Rated HP**—33.8. **Developed Horsepower**—110 at 3600 RPM (Std. hd.). **Compression Ratio**—6.3-1 Std., 5.7-1 Export. **Compression Pressure**—105 lbs. ± 10 lbs. at cranking speed of 100 RPM (Std. head). **Vacuum Reading**—Steady 17" min. at idling speed. *See Oldsmobile Shop Notes for Cylinder Head Servicing.*

PISTONS:—Aluminum alloy. T-slot, cam ground type with electro-hardened oxide bearing surface. **Weight**—16 ozs. (stripped). **Length**—3 15/16". **Removal**—Pistons and rods removed from above. **Clearance**—Top .023-.028". Skirt .0013-.0018". NOTE—Piston skirt taper inward from bottom to top should be .00025-.00075". Differs from Six. **Replacement Pistons:**—Finished pistons (pins fitted) .003", .005", .010", .015", .030" oversize. Same wt. as std. **Fitting New Pistons:**—Check piston for size with micrometers (pin removed) 90° from pin bosses ⅜" below lower ring groove and ⅜" from bottom of skirt. Insert .002" x ½" feeler between piston (pin removed) and cylinder wall on valve side with piston inverted and T-slot on opposite side from feeler. Pull to withdraw feeler must be 4 to 11 lbs. (piston and block at 70°—low limit below 70°, high above). **Installing pistons:**—Mark 'V-S' on head toward valves (slot away from valves). Pin hole offset 3/32".

PISTON RINGS:—2 compression (coated type—install with mark TOP up), 2 oil control, all above pin.

Ring	Width	End Gap	Side Clearance
Compr.	.0925-.0935"	.009-.014"	.001-.003"
Oil Cont.	.1860-.1865"	.009-.014"	.001-.0025"

Replacement Rings:—.010", .020", .030" oversize.

PISTON PIN:—**Diameter**—.8554-.8557". **Length** 2 31/32". Pin locked in one piston boss by lockscrew (opposite end slotted). Pin bosses are plated and must not be reamed. Standard size pins only serviced. **Pin Fit in Piston**—.0001" loose to .0002" tight (plain boss end), .0002-.0005" tight (lock boss end). **Pin Fit in Rod Bushing**—.0003-.0006" clearance. *See Oldsmobile Shop Notes for Pin Fitting directions.*

CONNECTING ROD:—**Length**—7 13/16". **Weight**—28.0 ounces (complete except for bearing inserts). NOTE—Six and Eight rods not interchangeable. **Crankpin Journal Diameter**—2.123-2.124". **Lower Bearing**—Removable steel-backed, babbitt. **Clearance**—.0005-.0025". **Sideplay**—.0055-.0105". **Bearing Adjustment:**—None. Replace bearings. **Installing Rods:**—Oil spit hole at lower end toward valves and grooves on rod and cap bolt boss (part number side) matched. Special ground cap bolts with self-locking nuts used and should be tightened with torque wrench to 50-55 lbs. ft. tension.

CRANKSHAFT:—5 bearing, 8 integral counterweights. **Journal Diameters**—#1, 2.478-2.479"; #2, 2.5405-2.5415"; #3, 2.603-2.604"; #4, 2.6655-2.6665"; #5, 2.6855-2.6865". **Bearings**—Removable, steel-backed, babbitt. Upper and lower halves interchangeable except #1 (front) which has additional short oil groove to front. **Clearance**—.0005-.002" (rear), .001-.003" (all others). **Bearing Adjustment:**—None (no shims). Replace bearings. Do not file caps. **Endplay**—.004-.008". NOTE—9/16" cap bolts on rear bearing, ½" others. *See Oldsmobile Shop Notes for Main Bearing Removal, Crankshaft End Thrust and Oil Seal data.*

CAMSHAFT:—5 bearing. Non-adjustable chain drive. **Journal Diameters**—#1, 2.0600-2.0595"; #2, 1.9975-1.9970"; #3, 1.9350-1.9345"; #4, 1.8725-1.8720"; #5, 1.8100-1.8095". **Bearings**—Bronze bushings. **Clearance** .0015-.0035". **End Thrust:**—Forward end thrust now taken by front engine support plate. *See Oldsmobile Shop Notes.* **Timing Chain:**—Link-Belt. Width 11/16" (after approx. 1st 10,000 cars), 1" (1st 10,000 cars). Pitch .500". Length 47 links or 23½". **Camshaft Setting:**—Mesh chain with sprocket marks adjacent and in line with a straightedge across the shaft centers (or use Tool HM-408-0).

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 9/16"	.3415-.3425"	5 51/64"
Exhaust	1 27/64"	.3410-.3418"	5 51/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.286"	.00175-.00375"
Exhaust	45°	.314"	.00245-.00425"

Tappet Clearance:—.008" Int., .011" Exh. Hot & idling. NOTE—Self-locking tappet screws used. Remove right fender filler plate for access to valves. **Valve Guides:**—Intake and exhaust guides same. Press guides in so top end ⅞" below top of block. (Tool J-1042 positions guide correctly in block). Ream to .34425-.34525" inside diam. (not tapered).

Valve Springs:—Same spring used on both valves and on 6&8 engines. Damper on top of each spring. Free length 2 19/32".

	Spring Pressure	Spring Length
Valve Closed	50½ lbs.	2¼"
Valve Open	95½ lbs.	1 15/16"

Valve Lifters:—Mushroom type (same on 6 & 8). Holes reamed in block have bearing-ized finish (if worn, fit oversize lifter without reaming hole) Body Diam. .6235-.6240". Furn .001", .002", .005", .010", OS. **Clearance**—.0005-.0008". NOTE— 1⅛" diameter face lifter only should be used on 1941 models. **Valve Timing:**—See Camshaft Setting above. **Intake Valves**—Open at TDC. Close 35° ALDC. **Exhaust Valves**—Open 45° BLDC. Close 10° ATDC. **Valve Timing Check**—With .0124" tappet clearance #1 intake valve should open with piston at top dead center (flywheel mark 'TDC/'—NOT STEEL BALL INSERT) aligned with pointer in left front face on flywheel hous'g. Reset tappet clear. .008" hot & idl'g.

LUBRICATION:—Pressure (gear type pump on right of engine). *See Oldsmobile Shop Notes for Oil Pump data.* **Normal Oil Pressure:**—28-33 lbs. **Oil Pressure Regulator:**—On pump, opens at 30 lbs. Non-adjustable type. **Crankcase Capacity:**—6 quarts.

COOLING SYSTEM:—**Capacity**—21½ quarts. *See Oldsmobile Shop Notes for Radiator Core Removal.* **Water Pump:**—Packless, sealed ball-bearing type. *For complete data, refer to 1941 Mech. Equip. Index.* **Thermostat:**—Harrison. In cylinder head outlet. **Setting**—Starts to open 152°F. Fully open 173°F. **Temperature Gauge:**—AC Electric #1511043 (dash), #1510772 (engine unit). *Refer to Mech. Equip. Index.*

CLUTCH (STD. TRANS.):—**Borg & Beck Model 10A7 with 'Borglite' driven member.** Marked #927 on cover. Single plate, dry disc type with sheet metal pressure plate oil baffle and release bearing lubrication fitting. *For data, refer to Mech. Equip. Index.* **Facings**—Spiral wound (spirally grooved) molded woven, 2 used. Inside Diam. 7". O.D. 10". ⅛" thick. **Pedal Adjustment:**—Free travel 1-1½". Turn link at fork in or out of clevis on auxiliary shaft. **Removal:**—Remove transmission (see data below), clutch underpan and reinforcing plate. Take out 6 mounting screws in clutch cover (when installing, use 2 long shank mounting screws in 2nd hole on each side of locating dowel), remove clutch. *See Oldsmobile Shop Notes for Clutch Housing Reinforcing Plate data.*

TRANSMISSION (STD.):—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote shift. *For complete data, refer to 1941 Mech. Equip. Index.* **Transmission Control:**—Oldsmobile 'Handi-shift' type. *For complete data, refer to 1941 Mech. Equip. Index.* **Removal:**—Disconnect shift and selector rods from levers at transmission, speedometer cable, rear universal and slide slip yoke and propeller shaft to rear. Remove four transmission mounting capscrews, pull transmission straight back and remove.

HYDRA-MATIC DRIVE (OPTL.):—**Own Make**—Consists of fluid coupling & automatic transmission. *For complete data, refer to 1941 Mech. Equip. Index.*

UNIVERSAL JOINTS:—**Mechanics 2C or 2CR (new type).** Roller bearing types. Two used. *For complete data, refer to 1941 Mech. Equip. Index.* NOTE—Slip joint formed at rear of transmission ahead of front U-joint (driveshaft 1 piece type).

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with torque taken through 2 support arms. *For complete data, refer to 1941 Mech. Equip. Index.* **Ratio**—**4.1-1** Std. 68. **4.3-1** Std. 78 & 98, Mountain ratio 68. **3.42-1** Hydra-Matic (all). **4.55-1** Mountain ratio 78 & 98. **3.9-1** Plains ratio (all). NOTE—Ring and pinion gear ratio (41-10, etc.) stamped on top side of differential carrier. **Backlash**—.004-.008". Screw adjustment. **Removal:**—Disconnect drive shaft at rear universal (do not disengage spline joint at transmission), remove axle shafts (see below), remove capscrews on carrier flange, pull carrier assembly out. **Axle Shaft Removal:**—*See 1941 Oldsmobile 6 page.* **Wheel Bearing Adjustment**—None. **Rear Suspension:**—Quadri-coil type (support arms). *For complete data, refer to 1941 Mech. Equip. Index.*

SHOCK ABSORBERS:—**Delco.** FRONT—Model 1947-C (right), D (left). RIGHT REAR—2105-E (78, 98), G (68). LEFT REAR—2105-F (78, 98), H (68). Double acting (parallel cylinder type rear), hydraulic. *For complete data, refer to 1941 Mech. Equip. Index.*

STEERING:—**Steering Gear**—Saginaw Worm-and-Roller type. *For data, refer to Mech. Equip. Index.* **Front Suspension:**—Independent, linked parallelogram type with coil springs. *For complete data, refer to 1941 Mech. Equip. Index.* **Kingpin Inclination**—4°51'10". **Caster**—0-¾° Negative. Adjustable. **Camber**—Negative ¼° to Positive ¾°. Adjustable. **Toe In**—1/16-⅛". Adjust each tie rod equally. **Steering Geometry**—Inner wh'l 23° ± ½°. Outer 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes. *For complete data, refer to 1941 Mech. Equip. Index.* **Wheel Cylinder Bore**—Front wheel 1 3/32". Rear 1". **Drums**—Cast-iron. Diameter 11". **Lining**—Molded. Width 1¾" (68), 2" (78, 98). Thickness 3/16". Length per shoe 9 11/32" (primary), 11 31/32" (secondary shoe). **Clearance**—.015" at both ends of secondary shoe with primary shoe forced out against drum. **Hand Brake:**—See Service Brakes above.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

FRONT END REMOVAL:—For work on front of engine, remove radiator and fender assembly as a unit as follows: drain cooling system, remove fender-to-body bolts, fender-to-running board bolts, fender to brace bolts, disconnect radiator hoses, free radiator tie rods, free radiator anchor bolt on frame remove running board molding from fender and lift entire assembly off. Above data applies to all 1900 models except 1951.

ORIGINAL BORE & PISTON SIZES:—Piston size indicated by mark stamped on head of each piston. Cylinder bore size indicated by mark stamped on top left face of cylinder block at Cylinder #4 (Six), #8 ('120' and Clipper Eights), #1 (Super Eight). Piston and cylinder marks should correspond (AA piston in AA bore, etc.) as shown in following tables:

'110' SIX, '160' AND '180' SUPER EIGHT

Mark	Piston Size	Cylinder Size
AA	3.49825-3.49850"	3.49950-3.49975"
A	3.49850-3.49875"	3.49975-3.50000"
BB	3.49875-3.49900"	3.50000-3.50025"
B	3.49900-3.49925"	3.50025-3.50050"
CC	3.49925-3.49950"	3.50050-3.50075"
C	3.49950-3.49975"	3.50075-3.50100"
DD	3.49975-3.50000"	3.50100-3.50125"
D	3.50000-3.50025"	3.50125-3.50150"

CLIPPER & '120' EIGHT

Mark	Piston Size	Cylinder Size
AA	3.24825-3.24850"	3.24950-3.24975"
A	3.24850-3.24875"	3.24975-3.25000"
BB	3.24875-3.24900"	3.25000-3.25025"
B	3.24900-3.24925"	3.25025-3.25050"
CC	3.24925-3.24950"	3.25050-3.25075"
C	3.24950-3.24975"	3.25075-3.25100"
DD	3.24975-3.25000"	3.25100-3.25125"
D	3.25000-3.25025"	3.25125-3.25150"

CYLINDER HEADS (ALL MODELS):—Cast iron heads used on all models. Each head marked by part number on front end (and letters 'HC' for optional high compression heads).

Car	Standard	High Compression
Six	354122	354675
Eight	348200	351243
Clipper	351243	
Super 8	341586	351254

Head Installation—Coat both sides of gasket with good grade of gasket paste (not necessary on Packard service gaskets which are supplied coated). Coat studs with grease and tighten stud nuts cold. Recheck stud nut tightening tension after engine warmed-up. *See Cylinder Head Tightening Order Diagrams and Torque Wrench Tightening Tension Tables in Mechanical Equipment Section. Refer to Mechanical Equipment Index.*

REPLACEMENT PISTONS:—Finished Autothermic, Cam-ground, Tin-plated type pistons (as furnished for installation on 1941 and previous car models) are stamped on head with decimal figure (.005, .010, etc.) indicating nominal oversize and one or two letters (AA, A, BB, B, CC, C, DD, D) which indicates the actual variation of the piston (in .00025" steps) from indicated nominal oversize. See oversizes listed below and size variations for each letter (in table).

This system of marking makes it possible to order a finished piston (using number and letter) for any particular finished bore size within these limits.

Piston Oversizes (Figures Stamped on Piston Head)—Standard size and .005", .010", .020", .030", .040" oversize. See Piston Variation in table below for size variation indicated by letter.

Piston Variation
(Letters Stamped on Piston Head)
For All Models and Piston Oversizes

AA—.00025" Under marked size.
A—Same as marked size.
BB—.00025" Over marked size.
B—.0005" Over marked size.
CC—.00075" Over marked size.
C—.001" Over marked size.
DD—.00125" Over marked size.
D—.0015" Over marked size.

PISTON PIN BUSHING (ALL MODELS):—Formed by two split type bushings pressed in rod eye from opposite sides so as to form oil groove in center. Rifle-drilled oil passage in rod must open into this groove. New split type piston pin bushing must be expanded to tight fit in rod with a burnishing tool and then reamed to size for correct fit (see 'M' page for fitting data).

CONNECTING ROD 'PALNUTS (6, 8, & CLIPPER):—Special patented self-locking locknuts are used on connecting rod bolt nuts in place of cotter pins. To install, turn regular connecting rod bolt up to desired point (see Tightening Specifications in Mechanical Equipment Section). Turn 'Palnut' on bolt (smooth side toward regular nut) until it contacts nut, then tighten Palnut ¼-⅓ additional turn to lock it in place.

OIL PUMP INSTALLATION (ALL MODELS):—Install pump with driving slot as near parallel as possible to center-line of camshaft with distributor rotor in line with #1 segment in cap. Punch mark on pump gear should be at the bottom (Six), at the top (8, Clipper, & Super 8). Recheck ignition timing.

1940 & PREVIOUS MODELS

CLUTCH LINKAGE SERVICING (MODELS 1700,1; 1800,1):—Clutch pedal linkage on these models allows pedal to move downward as wear develops and clearance at ends of rods increases. Pedal position must be checked to see that pedal travel sufficient to allow complete clutch disengagement. Note that this condition is just the reverse of pedal tending to come up due to lining wear on clutch plate.

Clutch Linkage Replacement—New 1941 design clutch pedal linkage can be installed on these cars. Car manufacturer recommends that 1941 design linkage be installed where linkage requires repair or replacement. Available under following part number: Clutch Relay Equipment Part No. 377473 (1700, 1800), 277494 (1701, 1801). NOTE—1941 design linkage installation same as for 1939 and 1940 models.

A flat washer Pc. No. 24595 (included with above equipment) must be installed between face of pedal extension and shoulder on stud to prevent stud being drawn into chamfered hole. This hole in pedal extension was chamfered on 1939 and 1940 models on both sides.

HOOD LOCK NOTE:—Hood is one-piece, side-hinge type with instrument panel lock control knobs and may be raised from either side after lock released on that side. To raise hood, press down and back on control knob on side on which hood to be raised. Raise hood about 1", press in on safety rod (lower edge of hood approx. 2' forward of rear of engine) to release safety catch, lift hood up and engage support prop in opening on underside of hood (prop pivoted on dash).

SERIAL NUMBER:—Stamped on plate on left side of dash under engine hood. First number 1401-2001.

ENGINE NUMBER:—On upper left side of engine block between #3 & #4 cylinders. First No. D-400051.

ENGINE SPECIFICATIONS:—Eight cylinder, 'L' head type. **Bore**—3¼". **Stroke**—4¼".
Displacement—282 cubic ins. **Rated HP.**—33.8.
Developed Horsepower—125 at 3600 RPM.
Compression Ratio—6.85-1 Std. cast iron head.
Compression Pressure—118 lbs. at 125 RPM. cranking speed.
Vacuum Reading—18-20" steady idling at 6 MPH.

PISTONS:—Aluminum alloy, autothermic, strut type, tin plated, cam ground type. **Length**—3⅞".
Weight—17¼ ozs. (stripped), 23⅛ (with rings&pin).
Removal—Pistons and rods removed from above.
Clearance—.0005"-.001". See Fitting New Pistons.
Original Bore & Piston Sizes, Replacement Pistons:—*See Packard Shop Notes for sizes and markings.*
Fitting New Pistons:—Insert .0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 12-18 lbs.
Installing Pistons:—Slot toward valves.

PISTON RINGS:—2 Ferrox coated compression rings (Perfect Circle—#1 K-200 upper inner edge beveled, #2 K-70 lower outer edge grooved), 1 oil control (X-90 'C' wall) ring, all above pin.
IMPORTANT NOTE—K type piston ring wall thickness greater than S.A.E. wall rings and need extra deep grooves. **Do not use S.A.E. wall rings in K ring grooves as ring breakage or over oiling may result.**

Ring	Width	End Gap	Side Clearance
Comp. (#1)	.0925-.0935"	.007-.017"	.0025-.003"
Comp. (#2)	.1240-.1235"	.007-.017"	.0025-.003"
Oil Control	.1865-.186"	.007-.015"	.0015-.002"

Replacement Rings:—.005, .010", .020", .030", .040" O.S.

PISTON PIN:—**Diameter**—.875". **Length**—2 51/64". Pin floats in piston and rod, held by locking rings.
Pin Fit in Piston—Finger push fit (piston at 160°).
Pin Fit in Rod Bushing—Finger push fit at 70°F.
Replacement Pins:—Std. and .003", .006" oversize.

CONNECTING ROD:—**Length** 7 11/16". **Weight** 31.6 ozs.
Upper Bearing (Piston Pin Bushing)—Split type.
See Packard Shop Notes for servicing data.
Crankpin Bearing Diameter—2 3/32".
Lower Bearing—Shimless, precision, steel backed, babbitt lined type. Bearings furnished standard and .001", .002", .003", .015" undersize.
Clearance—.0005-.0015". **Endplay**—.004-.010".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.
See Packard Shop Notes for 'Palnut' installation data.
Installing Rods:—Oil squirt hole toward camshaft.

CRANKSHAFT:—5 bearing, 8 integral counterweights and rubber friction disc vibration damper.
Bearing Diameter—2¾".
Bearings—Interchangeable, shimless, precision, steel-backed, babbitt lined type. Furnished standard size and .001", .002" undersize.
Clearance—.0005-.0015".
Bearing Adjustment:—None (no shims). Replace bearings (upper halves can be 'rotated' in and out).
End Thrust:—By #3 bearing. **Endplay**—.003-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive.
Bearings—Shimless, precision, steel backed, babbitt lined type. **Clearance**—.001-.003".
End Thrust:—Taken by thrust plate in back of camshaft sprocket. **Endplay**—.0025-.006".
Timing Chain:—Morse Type C-3682R (No. 1525) or Ramsey. Width 1¼". Pitch .375". Length 21¾" or 58 links.
Camshaft Setting:—Install chain and sprockets together with '0' marks on sprockets adjacent and in line with straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 31/64"	.33975"	5.619"
Exhaust	1⅜"	.33975"	5.619"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.318"	.002-.003"
Exhaust	45°	.3175"	.004-.005"

Tappet Clearance:—.007" Intake, .010" Exh. (warm & idling). NOTE—Self-locking tappet screw used.
Valve Guides:—Pressed in block from above with upper end 31/32" below valve seat. Exhaust guides counter-bored on upper inner diameter to ⅜" diameter and ⅜" deep.
Valve Springs:—Intake and exhaust springs interchangeable.

	Spring Pressure	Spring Length
Valve Closed	47-52 lbs.	1⅝"
Valve Open	114-124 lbs.	1 5/16"

NOTE—Serrated washer installed on top of springs.
Valve Lifters:—Mushroom type. Remove from below with camshaft out. Lifters furnished .001", .002", .005" oversize. Use Tool S.T. 5144 (piloted in valve guide) and ream for .005" oversize lifters.
Diameter—.6235-.6240". **Clearance**—.0003-.0012".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 1° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
Above figures correct with .0125" Intake, .015" Exhaust tappet clearance.
Valve Timing Check—With .0125" tappet clearance #1 intake valve should open with #1 piston 1° or .0004" BTDC with 1st graduation before top dead center mark '#1 UP.DC' on vibration damper lined up with pointer (permissible variation 4° either way). Reset tappet clearance .007" (hot & idling).

LUBRICATION:—Pressure (pump on right of engine).
See Packard Shop Notes for Oil Pump installation.
Normal Oil Pressure:—40 lbs. at 45 MPH.
Oil Pressure Relief Valve:—Mounted on pump cover. Not adjustable. Spring pressure 14 lbs. ± 2 oz.@1⅞".
Crankcase Capacity:—6 quarts.

COOLING SYSTEM:—**Capacity**—17 quarts.
Pressure Valve—In filler cap. Opens at 4½ lbs. (Std.), 12 lbs. (with Air Conditioning equipment).
Water Pump:—Packless, sealed ball-bearing type.
For complete data, refer to 1941 Mech. Equip. Index.
Removal—Remove fan belt, disconnect pump hose, take out pump mounting screws, lift out pump.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Starts to open 147½°.

CLUTCH:—**Long Model 10CF-CI.** Semi-centrifugal, single plate, dry disc type. *Refer to Mech. Equip. Index.*
Facings—Woven (U.S. Asbestos No. 1133-G), 2 used. Inside Diam. 6". Outside Diam. 10". Thick. .125".
Adjustment:—Adjust nut on pedal rod (at clutch fork) for 1½-1¾" free travel (2" on cars with Electromatic Clutch).
Removal:—Remove transmission (see Transmission Removal following) and flywheel housing lower cover. Disconnect and remove pedal rod, clutch throw-out bearing. Remove clutch cover screws (release tension evenly) and lower assembly out.
Electromatic Clutch Control:—Electric type. Optl.
For complete data, refer to 1941 Mech. Equip. Index.

TRANSMISSION:—**Own Make.** Constant-mesh, helical, ball-bearing mounted low speed gear (sliding spur reverse gear). Synchro-mesh (second & high).
For complete data, refer to 1941 Mech. Equip. Index.
Econo-Drive Transmission:—Warner-Packard type (Warner Model AS2-R9) overdrive unit with electrical control. Optional equipment on all cars.
For complete data, refer to 1941 Mech. Equip. Index.
Transmission Control:—Own Remote Control type.
For complete data, refer to 1941 Mech. Equip. Index.
Removal:—Disconnect shifter rods, speedometer cable, hand brake cable at equalizer, engine ground strap, overdrive cable and solenoid wires (if used), front universal (block drive shaft up against floor pan) and rubber bearing at rear of overdrive. Support rear of engine with jack and unbolt cross member (at frame ends and transmission case), disconnect clutch retractor spring. Take out transmission-to-flywheel housing screws, remove assembly.

UNIVERSAL JOINTS:—**Mechanics Model 3CR (new type).** Needle bearing type.
For complete data, refer to 1941 Mech. Equip. Index.
CAUTION—Rear universal flange nut controls pinion bearing pre-load (must be adjusted whenever nut is loosened). *Refer to Mechanical Equipment Index for 'Packard Rear Axle' for instructions.*

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with Hotchkiss drive. Cover welded in place.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—4.09-1 Std., 4.36-1 (with Econo-Drive).
Backlash—.003-.005". Screw adjustment.
Removal:—Remove wheel, hub, and brake backing plate assembly. Withdraw axle shafts. Disconnect rear universal joint and drop drive shaft. Remove carrier-to-housing bolt nuts, withdraw carrier.
Wheel Bearing Adjustment—Endplay controlled by shims between flanged end of housing and brake backing plate. Unbolt backing plate and clips holding brake tube to housing. Add or remove shims (endplay up to .050" can be adjusted to desired .006" at one wheel). **Endplay**—.004-.007".

SHOCK ABSORBERS:—**Front**—Delco Model 1946-J,K. Double acting, hydraulic type (part of Ind. Suspension). **Rear**—Monroe. Direct acting, hydraulic type.
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—**Steering Gear**—Packard (Gemmer design Model 330) Worm-and-roller type with new type steering linkage (idler arm on right frame siderail). Refer to Gemmer Model 330 article.
For complete data, refer to 1941 Mech. Equip. Index.
Front Suspension:—New type Packard 'Safe-T-Flex' Independent Suspension (parallelogram type upper and lower support arms—no torque arms).
For complete data, refer to 1941 Mech. Equip. Index.
Kingpin Inclination—5°35' crosswise.
Camber—¼° plus or minus ½°. Adjustable.
Caster—Neg. 1° plus or minus ½°. Adjustable.
Toe In—0" (plus 1/16", minus 0") at hub height. Adjust by turning adjuster at outer end of each tie rod equally.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
For complete data, refer to 1941 Mech. Equip. Index.
Drums—Centrifuse. Diameter 12".
Lining—Molded (Marshall 2201H-8). Width 1¾". Thick. 3/16". Length 11½" (primary shoe), 13" (secondary).
Clearance—.015" at both end of secondary shoe with primary shoe forced out against drum.
Hand Brake:—See Service Brake (above).

SERIAL NUMBER:—On left side of cowl (use Eng. No.).
ENGINE NUMBER:—First number D1551. On upper left side of block between #2 and #3 cylinders.
ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type.
Bore—3½". **Stroke**—4¼".
Displacement—245 cu. ins. **Rated HP**—29.4.
Developed Horsepower—100 at 3600 RPM (Std. hd.).
Compression Ratio and Pressure—As follows:
6.39-1 Std. cast-iron head—110 lbs. at 125 RPM.
6.71-1 Optl. HC cast-iron hd.—118 lbs. at 125 RPM.
See Packard Shop Notes for Cylinder Head data.
Vacuum Reading—18-20" steady idling at 6 MPH.
PISTONS:—Aluminum alloy, autothermic, strut type, tin plated, cam ground type. **Length**—3⅞".
Weight—20¼ ozs. (stripped), 26¾ (with rings & pin).
Removal—Pistons and rods removed from above.
Clearance—.0005-.001". See Fitting New Pistons.
Original Bore & Piston Sizes, Replacement Pistons:—*See Packard Shop Notes for sizes and markings.*
Fitting New Pistons:—Insert .0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 12-18 lbs.
Installing Pistons:—Slot toward valves.
PISTON RINGS:—2 Ferrox coated compression rings (Perfect Circle—#1 K-200 upper inner edge beveled, #2 K-70 lower outer edge grooved), 1 oil control (X-90 'C' wall) ring, all above pin.
IMPORTANT NOTE—K type piston ring wall thickness greater than S.A.E. wall rings and need extra deep grooves. **Do not use S.A.E. wall rings in K ring grooves as ring breakage or over oiling may result.**

Ring	Width	End Gap	Side Clearance
Comp. (#1)	.0930-.0935"	.007-.017"	.0025-.003"
Comp. (#2)	.1240-.1235"	.007-.017"	.0025-.003"
Oil Control	.1865-.186"	.007-.015"	.0015-.002"

Replacement Rings:—.005", .010", .020", .030", .040" O.S.
PISTON PIN:—**Diameter**—.875". **Length**—3 1/64". Pin floats in piston and rod, held by locking rings.
Pin Fit in Piston—Finger push fit (piston at 160°).
Pin Fit in Rod Bushing—Finger push fit at 70° F.
Replacement Pins:—Std. and .003", .006" oversize.
CONNECTING ROD:—**Length** 7 11/16". **Weight** 31.6 ozs.
Upper Bearing (Piston Pin Bushing)—Split type.
See Packard Shop Notes for servicing data.
Crankpin Bearing Diameter—2 3/32".
Lower Bearing—Shimless, precision, steel backed, babbitt lined type. Bearings furnished standard and .001", .002", .003", .015" undersize.
Clearance—.0005-.0015". **Endplay**—.004-.010".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps.
See Packard Shop Notes for 'Palnut' installation data.
Installing Rods:—Oil squirt hole toward camshaft.
CRANKSHAFT:—4 bearings, 6 integral counterweights
Bearing Diameter—2¾".
Bearings—Interchangeable, shimless, precision, steel-backed, babbitt lined type. Furnished standard size and .001", .002" undersize.
Clearance—.0005-.0015".
Bearing Adjustment:—None (no shims). Replace bearings (upper halves can be 'rotated' in and out).
End Thrust:—Taken by front (#1) bearing.
Endplay—.003-.008".
CAMSHAFT:—4 bearing. Non-adjustable chain drive.
See Packard Shop Notes for Radiator & Fender assembly (unit) removal for work on front end of engine.
Bearings—Shimless, precision, steel backed, babbitt lined type. **Clearance**—.001-.003".
End Thrust:—Taken by thrust plate in back of camshaft sprocket. **Endplay**—.0025-.006".
Timing Chain:—Morse Type C-3682R (No. 1525) or Ramsey. Width 1¼". Pitch .375". Length 21¾" or 58 links.
Camshaft Setting:—Install chain and sprockets together with '0' marks on sprockets adjacent and in line with straightedge across shaft centers.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 19/32"	.33975"	5.619"
Exhaust	1⅜"	.33975"	5.619"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.318"	.002-.003"
Exhaust	45°	.3175"	.004-.005"

Tappet Clearance:—.007" Intake, .010" Exh. (warm & idling). NOTE—Self-locking tappet screw used. Remove right front fender plate for access to valves.
Valve Guides:—Pressed in block from above with upper end 31/32" below valve seat. Exhaust guides counter-bored on upper inner diameter to ⅜" diameter and ⅜" deep.
Valve Springs:—Intake and exhaust springs interchangeable.

	Spring Pressure	Spring Length
Valve Closed	47-52 lbs.	1⅝"
Valve Open	114-124 lbs.	1 5/16"

NOTE—Serrated washer installed on top of springs.
Valve Lifters:—Mushroom type. Remove from below with camshaft out. Lifters furnished .001", .002", .005" oversize. Use Tool S.T. 5144 (piloted in valve guide) and ream for .005" oversize lifters.
Diameter—.6235-.6240". **Clearance**—.0003-.0012".
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 1° BTDC. Close 39° ALDC.
Exhaust Valves—Open 45° BLDC. Close 5° ATDC.
Above figures correct with .0125" Intake, .015" Exhaust tappet clearance.
Valve Timing Check—With .0125" tappet clearance #1 intake valve should open with #1 piston 1° or .0004" BTDC with 1st graduation before top dead center mark '#1 UP.DC' on vibration damper lined up with pointer (permissable variation 4° either way). Reset tappet clear. .007" (hot & idling).
LUBRICATION:—Pressure (pump on right of engine).
See Packard Shop Notes for Oil Pump installation.
Normal Oil Pressure:—40 lbs. at 45 MPH.
Oil Pressure Relief Valve:—Mounted on pump cover. Not adjustable. Spring pressure 14 lbs. ± 2 oz. @ 1⅞".
Crankcase Capacity:—5 quarts.
COOLING SYSTEM:—**Capacity**—15 quarts.
Pressure Valve—In filler cap. Opens at 4½ lbs. (Std.), 12 lbs. (with Air Conditioning equipment).
Water Pump:—Packless, sealed ball-bearing type.
For complete data, refer to 1941 Mech. Equip. Index.
Removal—Remove fan belt, disconnect pump hose, take out pump mounting screws, lift out pump.
Thermostat:—Bishop & Babcock. In head outlet.
Setting—Starts to open at 147½° F.
CLUTCH:—**Long Model 9½CF-CS, 11CFS-CI (Taxi).** Semi-centrifugal, single plate, dry disc types.
Taxi Note—Clutch is a riveted assembly.
For complete data, refer to 1941 Mech. Equip. Index.
Facings—Woven (U.S. Asbestos No. 1133-G), 2 used. I.D. 6", 6½" (Taxi). O.D. 9½", 11" (Taxi). Thick. ⅛".
Adjustment:—Adjust nut on pedal rod (at clutch fork) for 1½-1¾" free travel (2" when equipped with Electromatic Clutch).
Removal:—Remove transmission (see Transmission Removal following) and flywheel housing lower cover. Disconnect and remove pedal rod, clutch throw-out bearing. Remove clutch cover screws (release tension evenly) and lower assembly out.
Electromatic Clutch Control:—Electric type. Optl.
For complete data, refer to 1941 Mech. Equip. Index.
TRANSMISSION:—**Own Make.** Constant-mesh, helical, ball-bearing mounted low speed gear (sliding spur reverse gear). Synchro-mesh (second & high).
For complete data, refer to 1941 Mech. Equip. Index.
Econo-Drive Transmission:—Warner-Packard type (Warner Model AS2-R9) overdrive unit with electrical control. Optl. *Refer to Mech. Equip. Index.*
Transmission Control:—Own Remote Control type.
For complete data, refer to 1941 Mech. Equip. Index.
Removal:—Disconnect shifter rods, speedometer cable, hand brake cable at equalizer, engine ground strap, overdrive cable and solenoid wires (if used), front universal (block drive shaft up against floor pan) and rubber bearing at rear of overdrive. Support rear of engine with jack and unbolt cross member (at frame ends and flywheel housing lower cover). Disconnect clutch retractor spring and fore and aft restraint rod. Take out transmission-to-flywheel housing screws, remove assembly.
UNIVERSAL JOINTS:—**Detroit-Universal Series 4251 (4200 front, 5150 rear).** Front joint is ball & trunnion type with roller bearings (takes slip or end travel—no slip joint used). Rear joint is roller bearing type with cross.
For complete data, refer to 1941 Mech. Equip. Index.
CAUTION—Rear universal flange controls pinion bearing pre-load. *For complete data, refer to 1941 Mech. Equip. Index for Packard Rear Axle article.*
REAR AXLE:—**Own Make.** Semi-floating, Hypoid gear type with Hotchkiss drive. Cover welded in place.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—4.3-1 Std. 4.55-1 with Econo-Drive trans'm.
Backlash—.003-.005". Screw adjustment.
Removal:—Remove wheel, hub, and brake backing plate assembly. Withdraw axle shafts. Disconnect rear universal joint and drop drive shaft. Remove carrier-to-housing bolt nuts, withdraw carrier.
Wheel Bearing Adjustment—Endplay controlled by shims between flanged end of housing and brake backing plate. Unbolt backing plate and clips holding brake tube to housing. Add or remove shims (endplay up to .050" can be adjusted to desired .006" at one wheel). **Endplay**—.004-.007".

SHOCK ABSORBERS:—	Front	Rear
Domestic	Delco 1966-C,D	Monroe 364630
Export	Delco 1966-C,D	Delco 1130-W

Front shocks are double acting type. Rear shocks are direct acting (adjustable type Delco).
For complete data, refer to 1941 Mech. Equip. Index.
NOTE—No Fifth Shock Absorber used.
STEERING:—**Steering Gear**—Packard (Gemmer design Model 330) Worm-and-roller type with center steering. Refer to Gemmer Model 330 article.
For complete data, refer to 1941 Mech. Equip. Index.
Front Suspension:—Independent 'Safe-T-fleX' type (parallelogram type—coil springs & torque arms).
For complete data, refer to 1941 Mech. Equip. Index.
NOTE—Frame height must be set first before checking Caster and Camber.
Frame Height—With car on level floor, distance from floor to top of frame side rail at front wheel center-line 17⅝" (load car until figure correct).
Kingpin Inclination—2½° crosswise.
Camber—Pos. ½° (plus ¾°, minus 0°). Adjustable.
Caster—Pos. ½° ± ½°. Shim adjustment.
Toe In—0" (+ 1/16", — 0") at hub height. Turn both tie rods equally (rod lengths equal within ½").
Steering Geometry—Inner wheel 23½°. Outer 20°.
BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
For complete data, refer to 1941 Mech. Equip. Index.
Drums—Centrifuse. Diameter 11".
Lining—Molded (Marshall 2201). Width 1¾". Thick. 3/16". Length 10⅝" (primary shoe), 12" (secondary).
Clearance—.015" at both ends of secondary shoe with primary shoe forced out against drum.
Hand Brake:—See Service Brakes above.

SERIAL NUMBER:—On left side of cowl (use Eng. No.).
ENGINE NUMBER:—First number D300051. On upper left side of block between #2 and #3 cylinders.
ENGINE SPECIFICATIONS:—8 cylinder, 'L' head type. **Bore**—3¼". **Stroke**—4¼". **Displacement**—282 cu. ins. **Rated HP**—33.8. **Developed Horsepower**—120 at 3600 RPM (Std. hd.). **Compression Ratio and Pressure**—As follows: 6.41-1 Std. cast-iron head—110 lbs. at 125 RPM. 6.85-1 Optl. HC cast-iron hd.—118 lbs. at 125 RPM. *See Packard Shop Notes for Cylinder Head data.* **Vacuum Reading**—18-20" steady idling at 6 MPH.
PISTONS:—Aluminum alloy, autothermic, strut type, tin plated, cam ground type. **Length**—3⅞". **Weight**—17¼ oz. (stripped), 23⅛ (with rings & pin). **Removal**—Pistons and rods removed from above. **Clearance**—.0005-.001". See Fitting New Pistons.
Original Bore & Piston Sizes, Replacement Pistons:—*See Packard Shop Notes for sizes and markings.*
Fitting New Pistons:—Insert .0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 12-18 lbs.
Installing Pistons:—Slot toward valves.
PISTON RINGS:—2 Ferrox coated compression rings (Perfect Circle—#1 K-200 upper inner edge beveled, #2 K-70 lower outer edge grooved), 1 oil control (X-90 'C' wall) ring, all above pin.
IMPORTANT NOTE—K type piston ring wall thickness greater than S.A.E. wall rings and need extra deep grooves. **Do not use S.A.E. wall rings in K ring grooves as ring breakage or over oiling may result.**

Ring	Width	End Gap	Side Clearance
Comp. (#1)	.0925-.0935"	.007-.017"	.0025-.003"
Comp. (#2)	.1240-.1235"	.007-.017"	.0025-.003"
Oil Control	.1865-.186"	.007-.015"	.0015-.002"

Replacement Rings:—.005", .010", .020", .030", .040" O.S.
PISTON PIN:—**Diameter**—.875". **Length**—2 51/64". Pin floats in piston and rod, held by locking rings. **Pin Fit in Piston**—Finger push fit (piston at 160°). **Pin Fit in Rod Bushing**—Finger push fit at 70° F.
Replacement Pins:—Std. and .003", .006" oversize.
CONNECTING ROD:—**Length** 7 11/16". **Weight** 31.6 ozs. **Upper Bearing (Piston Pin Bushing)**—Split type. *See Packard Shop Notes for servicing data.* **Crankpin Bearing Diameter**—2 3/32". **Lower Bearing**—Shimless, precision, steel backed, babbitt lined type. Bearings furnished standard and .001", .002", .003", .015" undersize. **Clearance**—.0005-.0015". **Endplay**—.004-.010".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. *See Packard Shop Notes for 'Palnut' installation data.*
Installing Rods:—Oil squirt hole toward camshaft.
CRANKSHAFT:—5 bearings, 8 integral counterweights **Bearing Diameter**—2¾". **Bearings**—Interchangeable, shimless, precision, steel-backed, babbitt lined type. Furnished standard size and .001", .002" undersize. **Clearance**—.0005-.0015".
Bearing Adjustment:—None (no shims). Replace bearings (upper halves can be 'rotated' in and out).
End Thrust:—By #3 bearing. **Endplay**—.003-.008".
CAMSHAFT:—5 bearing. Non-adjustable chain drive. *See Packard Shop Notes for Radiator & Fender assembly (unit) removal for work on front end of engine.* **Bearings**—Shimless, precision, steel backed, babbitt lined type. **Clearance**—.001-.003".
End Thrust:—Taken by thrust plate in back of camshaft sprocket. **Endplay**—.0025-.006".
Timing Chain:—Morse Type C-3682R (No. 1525) or Ramsey. Width 1¼". Pitch .375". Length 21¾" or 58 links.
Camshaft Setting:—Install chain and sprockets together with '0' marks on sprockets adjacent and in line with straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 31/64"	.33975"	5.619"
Exhaust	1⅜"	.33975"	5.619"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.318"	.002-.003"
Exhaust	45°	.3175"	.004-.005"

Tappet Clearance:—.007" Intake, .010" Exh. (warm & idling). NOTE—Self-locking tappet screw used. Remove right front fender plate for access to valves.
Valve Guides:—Pressed in block from above with upper end 31/32" below valve seat. Exhaust guides counter-bored on upper inner diameter to ⅜" diameter and ⅜" deep.
Valve Springs:—Intake and exhaust springs interchangeable.

	Spring Pressure	Spring Length
Valve Closed	47-52 lbs.	1⅝"
Valve Open	114-124 lbs.	1 5/16"

NOTE—Serrated washer installed on top of springs.
Valve Lifters:—Mushroom type. Remove from below with camshaft out. Lifters furnished .001", .002", .005" oversize. Use Tool S.T. 5144 (piloted in valve guide) and ream for .005" oversize lifters. **Diameter**—.6235-.6240". **Clearance**—.0003-.0012".
Valve Timing:—See Camshaft Setting above. **Intake Valves**—Open 1° BTDC. Close 39° ALDC. **Exhaust Valves**—Open 45° BLDC. Close 5° ATDC. Above figures correct with .0125" Intake, .015" Exhaust tappet clearance. **Valve Timing Check**—With .0125" tappet clearance #1 intake valve should open with #1 piston 1° or .0004" BTDC with 1st graduation before top dead center mark '#1 UP.DC' on vibration damper lined up with pointer (permissable variation 4° either way). Reset tappet clear. .007" (hot & idling).
LUBRICATION:—Pressure (pump on right of engine). *See Packard Shop Notes for Oil Pump installation.*
Normal Oil Pressure:—40 lbs. at 45 MPH.
Oil Pressure Relief Valve:—Mounted on pump cover. Not adjustable. Spring pressure 14 lbs. ± 2 oz. @ 1⅞".
Crankcase Capacity:—6 quarts.
COOLING SYSTEM:—**Capacity**—17 quarts. **Pressure Valve**—In filler cap. Opens at 4½ lbs. (Std.), 12 lbs. (with Air Conditioning equipment).
Water Pump:—Packless, sealed ball-bearing type. *For complete data, refer to 1941 Mech. Equip. Index.* **Removal**—Remove fan belt, disconnect pump hose, take out pump mounting screws, lift out pump.
Thermostat:—Harrison. In cylinder head outlet. **Setting**—Starts to open 147½°.
CLUTCH:—**Long Model 10CF-CI.** Semi-centrifugal, single plate, dry disc type. *Refer to Mech. Equip. Index.* **Facings**—Woven (1901—U. S. Asbestos 1133-G, 1901-A—Hycoe DV3112A), 2 required. Inside Diameter 6". Outside Diameter 10". Thickness .125".
Adjustment:—Adjust nut on pedal rod (at clutch fork) for 1½-1¾" free travel (2" when equipped with Electromatic Clutch).
Removal:—Remove transmission (see Transmission Removal following) and flywheel housing lower cover. Disconnect and remove pedal rod, clutch throw-out bearing. Remove clutch cover screws (release tension evenly) and lower assembly out.
Electromatic Clutch Control:—Electric type. Optl. *For complete data, refer to 1941 Mech. Equip. Index.*
TRANSMISSION:—**Own Make.** Constant-mesh, helical, ball-bearing mounted low speed gear (sliding spur reverse gear). Synchro-mesh (second & high). *For complete data, refer to 1941 Mech. Equip. Index.*
Econo-Drive Transmission:—Warner-Packard type (Warner Model AS2-R9) overdrive unit with electrical control. Optl. *Refer to Mech. Equip. Index.*
Transmission Control:—Own Remote Control type. *For complete data, refer to 1941 Mech. Equip. Index.*
Removal:—Disconnect shifter rods, speedometer cable, hand brake cable at equalizer, engine ground strap, overdrive cable and solenoid wires (if used), front universal (block drive shaft up against floor pan) and rubber bearing at rear of overdrive. Support rear of engine with jack and unbolt cross member (at frame ends and flywheel housing lower cover). Disconnect clutch retractor spring and fore and aft restraint rod. Take out transmission-to-flywheel housing screws, remove assembly.
UNIVERSAL JOINTS:—**Mechanics Model 3CR (new type), 3C (front shaft 1901A).** Needle bearing type. *For complete data, refer to 1941 Mech. Equip. Index.* CAUTION—Rear universal flange controls pinion bearing pre-load. *For complete data, refer to 1941 Mech. Equip. Index for Packard Rear Axle article.*
REAR AXLE:—**Own Make.** Semi-floating, Hypoid gear type with Hotchkiss drive. Cover welded in place. *For complete data, refer to 1941 Mech. Equip. Index.* **Ratio**—Std: 4.09-1 (1901); 4.7-1, 4.9-1 or 5.22-1 (1901A). For Econo-Drive: 4.36-1 (1901), 4.9-1 (1901A). **Backlash**—.003-.005". Screw adjustment.
Removal:—Remove wheel, hub, and brake backing plate assembly. Withdraw axle shafts. Disconnect rear universal joint and drop drive shaft. Remove carrier-to-housing bolt nuts, withdraw carrier. **Wheel Bearing Adjustment**—Endplay controlled by shims between flanged end of housing and brake backing plate. Unbolt backing plate and clips holding brake tube to housing. Add or remove shims (endplay up to .050" can be adjusted to desired .006" at one wheel). **Endplay**—.004-.007".
SHOCK ABSORBERS:—

	Delco: Front	Rear
1901, 1901A	1966-C,D	1021-V
1901 Export	1966-C,D	1030-W

Double acting type (1966-C,D), Direct acting (1021-V), Adjustable direct acting (1030-W). *For complete data, refer to 1941 Mech. Equip. Index.*
Fifth Shock Absorber (Stabilizer):—Houdaille Model NFT. Double acting, hydraulic, adjustable type. *For complete data, refer to 1941 Mech. Equip. Index.*
STEERING:—**Steering Gear**—Packard (Gemmer design Model 330) Worm-and-roller type with center steering. Refer to Gemmer Model 330 article. *For complete data, refer to 1941 Mech. Equip. Index.*
Front Suspension:—Independent 'Safe-T-fleX' type (parallelogram type—coil springs & torque arms). *For complete data, refer to 1941 Mech. Equip. Index.* NOTE—Frame height must be set first before checking Caster and Camber.
Frame Height—With car on level floor, distance from floor to top of frame side rail at front wheel center-line 18⅛" (1901), 18¾" (1901A). Load car until this figure obtained. **Kingpin Inclination**—2½° crosswise. **Camber**—Pos. ½° (plus ¾°, minus 0°). Adjustable. **Caster**—Pos. ½° ± ½°. Shim adjustment. **Toe In**—0" (+ 1/16", — 0") at hub height. Turn both tie rods equally (rod lengths equal within ½"). **Steering Geometry**—Inner wheel 23½°. Outer 20°.
BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes. *For complete data, refer to 1941 Mech. Equip. Index.* **1901A Note**—*See 1941 Packard Super 8 'M' page.* **Drums**—Centrifuse. Diameter 12". **Lining**—Molded (Marshall 2201). Width 1¾". Thick. 3/16". Length 11½" (primary shoe), 13" (secondary). **Clearance**—.015" at both ends of secondary shoe with primary shoe forced out against drum.
Hand Brake:—See Service Brake (above).

SERIAL NUMBER:—On left side of cowl (use Eng. No.).
ENGINE NUMBER:—First number D-500,051 (1903,4,5), CD-500,051 (1906,7,8). Stamped on upper left side of cylinder block between #3 and #4 cylinders.
ENGINE SPECIFICATIONS:—8 cylinder, 'L' head type. **Bore**—3½". **Stroke**—4⅝". **Displacement**—356 cu. ins. **Rated HP**—39.2. **Developed Horsepower**—160 at 3600 RPM (Std. hd.). **Compression Ratio**—6.45-1 Std., 6.85-1 Optl. CI hds. **Compression Pressure**—118 lbs. at cranking speed for standard 6.45-1 head. *See Packard Shop Notes for Cylinder Head data.* **Vacuum Reading**—18½" steady idling at 6 MPH.
PISTONS:—Aluminum alloy, autothermic, strut type, tin plated, cam ground type. **Length**—3⅞". **Weight**—20¼ ozs. (stripped), 26¾" (with rings&pin). **Removal**—Pistons and rods removed from above. **Clearance**—.0005-.001". See Fitting New Pistons. **Original Bore & Piston Sizes, Replacement Pistons:**—*See Packard Shop Notes for sizes and markings.* **Fitting New Pistons:**—Insert .0015" feeler ½" wide between piston and cylinder wall on side opposite slot. Pull to withdraw feeler should be 12-18 lbs. **Installing Pistons:**—Slot toward valves.
PISTON RINGS:—2 Ferrox coated compression rings (Perfect Circle—#1 K-200 upper inner edge grooved, #2 K-70 lower outer edge grooved), 1 oil control (X-90 'C' wall) ring, all above pin. IMPORTANT NOTE—K type piston ring wall thickness greater than S.A.E. wall rings and need extra deep grooves. **Do not use S.A.E. wall rings in K ring grooves as ring breakage or over oiling may result.**

Ring	Width	End Gap	Side Clearance
Comp. (#1)	.0930-.0935"	.007-.017"	.0025-.003"
Comp. (#2)	.1240-.1235"	.007-.017"	.0025-.003"
Oil Control	.1865-.186"	.007-.015"	.0015-.002"

Replacement Rings:—.005", .010", .020", .030", .040" O.S.
PISTON PIN:—**Diameter**—.875". **Length**—3 1/64". Pin floats in piston and rod, held by locking rings. **Pin Fit in Piston**—Finger push fit (piston at 160°). **Pin Fit in Rod Bushing**—Finger push fit at 70° F. **Replacement Pins:**—Std. and .003", .006" oversize.
CONNECTING ROD:—**Length** 9¼". **Weight** 42.0 ozs. **Upper Bearing (Piston Pin Bushing)**—Split type. *See Packard Shop Notes for servicing data.* **Crankpin Bearing Diameter**—2¼". **Lower Bearing**—Shimless, precision, steel backed, babbitt lined type. Bearings furnished standard and .001", .002", .003", .015" undersize. **Clearance**—.0005-.0015". **Endplay**—.004-.010". **Bearing Adjustment:**—None (no shims). Replace bearings. Do not file rods or caps. **Installing Rods:**—Oil squirt hole toward camshaft.
CRANKSHAFT:—9 bearings, 8 bolted counterweights **Bearing Diameter**—2¾". **Bearings**—Interchangeable, shimless, precision, steel-backed, babbitt lined type. Furnished standard size and .001", .002" undersize. **Clearance**—.0005-.0015". **Bearing Adjustment:**—None (no shims). Replace bearings (upper halves can be 'rotated' in and out). **End Thrust:**—By #5 bearing. **Endplay**—.003-.008".
CAMSHAFT:—8 bearing. Non-adjustable chain drive. *See Packard Shop Notes for Radiator & Fender Assembly (unit) removal for work on front end of engine.* **Bearings**—Shimless, precision, steel-backed, babbitt lined type. **Clearance**—.001-.003". **End Thrust:**—Taken by thrust plate in back of camshaft sprocket. **Endplay**—.0025-.006". **Timing Chain:**—Morse Type C-3682R (No. 765). Width 1¼". Pitch .375". Length 62 links or 23¼". **Camshaft Setting:**—Install chain and sprockets together with '0' marks on sprockets adjacent and in line with a straightedge across the shaft centers.
VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1.670"	.33975"	6.212"
Exhaust	1 7/16"	.33975"	6.212"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.340"	.002-.003"
Exhaust	45°	.340"	.004-.005"

Tappet Clearance:—None (automatic take-up used). **Valve Guides:**—Pressed in block from above with upper end 31/32" below valve seat. Exhaust guides counter-bored on upper inner diameter to ⅜" diameter and ⅜" deep. **Valve Springs:**—Washer used on top of each spring.

	Spring Pressure	Spring Length
Valve Closed	55-61 lbs.	1¾"
Valve Open	130-140 lbs.	1 13/32"

Valve Lifters:—Wilcox-Rich 'Zero-lash' type hydraulic lifters (mushroom type). Remove from below with camshaft out. Lifters furnished .001", .002", .005" oversize. Use Tool S.T. 5101 (piloted in valve guide) and ream for .005" oversize lifters. **Diameter** .7177-.7182". **Clearance** .0002" selective. *For complete data, refer to 1941 Mech. Equip. Index.* **Valve Timing:**—See Camshaft Setting above. **Intake Valves**—Open 4° BTDC. Close 51° ALDC. **Exhaust Valves**—Open 49° BLDC. Close 10° ATDC. **Valve Timing Check**—#1 exhaust valve close 10° after top dead center (#1 piston .0438" ATDC) with hydraulic lifter dry (all oil drained out) and built up with feeler stock for zero tappet clearance.
LUBRICATION:—Pressure (pump on right of engine). *See Packard Shop Notes for Oil Pump Installation.* **Normal Oil Pressure:**—50 lbs. at 45 MPH. **Oil Pressure Relief Valve:**—On pump cover. Not adjustable. Spring pressure 17½-18½ lbs. at 1⅞". **Crankcase Capacity:**—7 quarts.
COOLING SYSTEM:—**Capacity**—20 quarts. **Pressure Valve**—In filler cap. Opens at 7 lbs. (Std.), 12 lbs. (with Air Conditioning equipment). **Water Pump:**—Packless, sealed ball-bearing type. *For complete data, refer to 1941 Mech. Equip. Index.* **Removal**—Remove fan belt, disconnect pump hose, take out pump mounting screws, lift out pump. **Thermostat:**—Harrison. In radiator top tank (operates radiator shutters). Starts to open 135°F. NOTE—If cylinder head water outlet thermostat used, this thermostat starts to open at 162½°F.
CLUTCH:—**Long Model 11CFS-CI.** Semi-centrifugal single plate, dry disc type (riveted assembly). *For complete data, refer to 1941 Mech. Equip. Index.* **Facings**—Woven (U.S. Asbestos No. 1133-G), 2 used. Inside Diam. 6½". Outside Diam. 11". Thick. .125". **Adjustment:**—Adjust nut on pedal rod (at clutch fork) for 1¾-2¼" free travel. **Removal:**—Remove transmission (see Transmission Removal following) and flywheel housing lower cover. Disconnect and remove pedal rod, clutch throw-out bearing. Remove clutch cover screws (release tension evenly) and lower assembly out. **Electromatic Cluteh Control:**—Electric type. Optl. *For complete data, refer to 1941 Mech. Equip. Index.*
TRANSMISSION:—**Own Make.** Constant-mesh, helical, ball-bearing mounted low speed gear (sliding spur reverse gear). Synchro-mesh (second & high). *For complete data, refer to 1941 Mech. Equip. Index.* **Econo-Drive Transmission:**—Warner-Packard type (Warner Model AS1-R9A) overdrive unit with electrical control. Optional equipment on all cars. *For complete data, refer to 1941 Mech. Equip. Index.* **Transmission Control:**—Own Remote Control type. *For complete data, refer to 1941 Mech. Equip. Index.* **Removal:**—*See 1941 Packard 8 '120' M page.*
UNIVERSAL JOINTS:—**Mechanics Model 3CR (new type), 3C (front shaft 1903A,6,7,8).** Needle bearing. *For complete data, refer to 1941 Mech. Equip. Index.* CAUTION—Rear universal flange controls pinion bearing pre-load. *For complete data, refer to 1941 Mech. Equip. Index for Packard Rear Axle article.*
REAR AXLE:—**Own Make.** Semi-floating, Hypoid gear type with Hotchkiss drive and special Ring Gear Support Roller. Cover welded in place. *For complete data, refer to 1941 Mech. Equip. Index.*

Model	Ratios: Std.	Econo-Dr.	Optl.
1903, 1906	3.92-1	4.36-1	4.09-1
1904, 1907	4.09-1	4.36-1	4.36-1
1905, 1908	4.36-1	4.54-1	4.54-1
1903A	4.54-1	4.7-1	4.7-1
1903AB	5.12-1		

Backlash—.003-.005". Screw adjustment. **Removal & Wheel Bearing Adjustment:**—*See 1941 Packard 8 Model 1901,1A 'M' page (preceding) for data.*
SHOCK ABSORBERS:—**Front**—Delco Model 1966-C,D. Double acting, hydraulic type. **Rear** 1903 Coupes & 1906: Monroe 364725 (Valve Assembly 11423 superseded by 11428); 1903 Sedans: Monroe 362710; All Others: Delco 1021-V; All Models Export: Delco 1030-W. All rear shocks are hydraulic, direct acting type (Delco 1030-W is an adjustable direct type). *For complete data, refer to 1941 Mech. Equip. Index.* **Fifth Shock Absorber (Stabilizer):**—Houdaille Model NFT. Double acting, hydraulic, adjustable type. *For complete data, refer to 1941 Mech. Equip. Index.*
STEERING:—**Steering Gear**—Packard (Gemmer design Model 330) Worm-and-roller type with center steering. Refer to Gemmer Model 330 article. *For complete data, refer to 1941 Mech. Equip. Index.* **Front Suspension:**—Independent 'Safe-T-fleX' type (parallelogram type—coil springs & torque arms). *For complete data, refer to 1941 Mech. Equip. Index.* NOTE—Frame height must be set first before checking Caster and Camber. **Frame Height**—With car on level floor, distance from floor to top of frame side rail at front wheel center-line 18¾" (1903,4,5,6,7,8), 19¼" (1903A, 3AB). Load car until figure correct. **Kingpin Inclination**—2½° crosswise. **Camber**—Pos. ½° (plus ¾°, minus 0°). Adjustable. **Caster**—Negative ¾° plus or minus ½° (all except 1903A, 3AB). 2½° plus or minus ½° (1903A, 3AB only). **Toe In**—0" (+ 1/16", — 0") at hub height. Turn both tie rods equally (rod lengths equal within ½"). **Steering Geometry**—Inner wheel 23½°. Outer 20°.
BRAKES:—Service. Bendix hydraulic, duo-servo, single anchor type with eccentric adjustment (except 1903 & 6). Hand lever applies rear service brakes. *For complete data, refer to 1941 Mech. Equip. Index.* **Drum**—Centrifuse. Diameter 12". **Lining**—Moulded type. Marshall 2201.

Model	Width	Thickness	Length per Shoe Primary	Secondary
1903,6	2"	3/16"	11½"	13"
1904,5,7,8	2¼"	3/16"	13"	13"
1901A①	2¼"	3/16"	13"	13"
1901A②	2½"	3/16"	13"	—
1901A②	2¼"	3/16"	—	13"
1903A①	2½"	3/16"	13"	13"
1903AB③ Front	2½"	3/16"	13"	13"
1903AB③ Rear	2¾"	3/16"	15"	15"

①—Hearse & Ambulance. ③—Airport Limousine.
②—Heavy Duty Ambulance 4194HD, 4194HDF.
Clearance—All except 1903,6—.010" at heel and toe of each shoe. **1903,6**—.015" at both ends of secondary shoe with primary shoe forced out against drum.
Hand Brake:—See Service Brakes (above).

HOOD LOCK, FRONT END ASSEMBLY & OIL PAN REMOVAL:—*See Chrysler Shop Notes.*

SERIAL NUMBER:—On right front door hinge post.

	Detroit	Los Angeles	Evansville	Canada
P11	15,000,101	3,121,501	22,001,001	9,821,241
P12	11,123,001	3,269,301	20,105,001	9,616,761

ENGINE NUMBER:—P11-1001 (P11), P12-1001 & up (P12). On left side of block between #1 & #2 cyls. *See Chrysler Shop Notes for Engine Number Lettering data ('Special Standard' bore and bearing sizes).*

ECONOMY MODEL NOTE:—These cars have special Carburetor and Rear Axle ratio. Identified by 'E' in Eng. No. as follows: P11-E-1001 or P12-E-1001.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3⅛". **Stroke**—4⅜".
Displacement—201.3 cu. ins. **Rated HP**—23.44.
Developed Horsepower—87 HP at 3800 RPM.
Compression Ratio—6.7-1 cast-iron head std.
Compression Pressure—145-155 lbs. at 1000 RPM or 110-120 lbs. at cranking speed (125 RPM).
Vacuum Reading—Steady 18-20" idling (below 1000'). *See Chrysler Shop Notes for Engine Removal directions.*

PISTONS:—Two types used optionally: (1)—Aluminum alloy, U-slot, cam ground, tin coated. **Length**—3 11/16". **Weight**—14.4 ozs. (stripped). **(2)**—Steel banded, aluminum alloy and steel. **Length**—3 5/16". **Weight**—14.5 ozs. (stripped).
Removal—Pistons and rods removed from above.
Clearance—Top land .028" (U-slot), .031" (steel banded). Skirt .0001-.0011" (U-slot), .001-.002" (steel).
Original Bore & Piston Sizes, Replacement Pistons:—*See Chrysler Shop Notes for sizes and markings.*
Fitting New Pistons:—Check piston size with micrometer at bottom of skirt at right angles to pin bosses. With piston and wall dry, piston should pass through bore of own weight (pin removed) with slight drag at normal room temperature (70° F.).
Installing Pistons:—Slot away from valves (U-slot). Strut toward front of engine (steel-banded type).

PISTON RINGS:—4 rings, all above pin—#1 Compression (upper inner edge stepped), #2 Comp. (lower outer edge stepped), #3 and #4 (slotted oil rings).

Ring	Width	End Gap	Side Clearance
Compr. (Top)	3/32"	.007-.015"	.0025-.004"
Compr. (#2)	⅛"	.007-.015"	.0015-.0035"
Oil Control	5/32"	.007-.015"	.001-.0025"

Replacement Rings:—Std. & .003", .005", .010", .015", .020", .023", .025", .030", .040", .050", .060" oversize.

PISTON PIN:—**Diameter**—55/64". **Length**—2⅝". Floating type. Pin hole in rod bronze bushed.
Pin Fit in Piston—Thumb push fit (piston at 100°).
Pin Fit in Rod Bushing—Thumb push fit at 70° F.
Replacement Pins:—Std. & .003", .005", .008" oversize.

CONNECTING ROD:—**Weight** 31.52 ozs. (with bearings and bolts). **Length**—7 15/16".
Lower Bearing Diameter—1 15/16". *See Engine Lettering Note in Chrysler Shop Notes for 'Special Std.' size.*
Lower Bearing—Removable, precision type, thin babbitt. **Clearance** .0005-.0015". **Sideplay** .0055-.0115".
Bearing Adjustment:—None (no shims). Replace bearings. *See Chrysler Shop Notes for instructions.*
Replacement Bearings:—*See Chrysler Shop Notes.*
Installing Rods:—Wide portion of bearing to rear (#1, 3, 5) to front (#2, 4, 6). Oil hole to camshaft.

CRANKSHAFT:—4 bearings, 7 integral counterweights. *See Chrysler Shop Notes for Replacement Main Bearing Caps and Crankshaft Front and Rear Oil Seals.*
Bearing Diameters—2¼". *See Engine Lettering Note in Chrysler Shop Notes for 'Special Standard' size.*
Bearing Type—Removable, precision type, thin babbitt on steel. **Clearance**—.001-.002".
Bearing Adjustment:—*See Chrysler Shop Notes for bearing removal, replacement sizes and adjustment data.*
End Thrust:—Taken by flange faces on rear (#4) main bearing. **Endplay**—.003-.007".

CAMSHAFT:—4 bearing. Non-adjustable chain drive. NOTE—2 types used (see Valve Timing).
See Chrysler Shop Notes for Camshaft Removal.
Bearing Diameters—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1¼".
Bearing Type—Removable steel-backed, babbitt-lined bushings (except #4 machined in block).
Clearance—.001-.003" (#1), .0015-.0035" (all others).
End Thrust:—Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".
Timing Chain:—Morse Type 1883N, No. 2661. Width 1". Pitch .500" (½"). Length 24" or 48 links.
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
All Valves	1 15/32"	.340-.341"	4 25/32"

	Seat Angle	Lift	Stem Clearance
Intake	45°	⅜"	.001-.003"
Exhaust	45°	⅜"	.003-.005"

See Chrysler Shop Notes for Exhaust Valve Seat Inserts.
Tappet Clearance:—.008" Intake, .010" Exh. (hot and idling), .002" additional exh. clearance desirable for sustained high speeds. NOTE—Tappet screws self-locking (no locknuts). Remove right front wheel and lower wheel housing panel for access to valves.
Valve Guides:—Remove from above. Press new guides in (stepped end down) with upper end ⅞" below top of block, ream to .342-.343" Int., .344-.345" Exh.
Valve Springs:—Install with closely coiled end to top.

	Spring Pressure	Length
Free length 2".		
Valve Closed	40- 45 lbs.	1¾"
Valve Open	107-115 lbs.	1⅜"

Valve Lifters:—Mushroom type (remove from below). Stem diam. ⅝". Ream holes from above (pilot in valve guide). Oversizes .001", .008", .030" & .060".
Lifter Clearance in Block—.000-.001".
Valve Timing:—See Camshaft Setting above.
Engine Numbers 1001 to 150391
Intake Valves—Open 12° BTDC. Close 44° ALDC.
Exhaust Valves—Open 50° BLDC. Close 6° ATDC.
Engine Number 150392 and Up
Intake Valves—Open 9° BTDC. Close 47° ALDC.
Exhaust Valves—Open 47° BLDC. Close 9° ATDC.
Valve Timing Check—With .014" (cold) tappet clearance #6 intake valve should open with #6 piston **12° or .060" (up to Engine No. 150391), 9° or .0343" BTDC (Engine No 150392 and Up)** with 12th graduation (first cars), 9th graduation (later cars) before DC mark on crankshaft pulley aligned with pointer on cover. Reset tappet clear .008" hot.

LUBRICATION:—Pressure (pump on right of engine). *See Chrysler Shop Notes for Oil Pump Removal.*
Normal Oil Pressure:—30-45 lbs. at 30 MPH and above.
Oil Pressure Relief Valve:—Under plug below starter. Opens at 40-45 lbs. Spring painted red, green or unmarked. If spring replaced, use same color spring.
Crankcase Capacity:—5 quarts (refill).

COOLING SYSTEM:—**Capacity** 14 qts. *See Chrysler Shop Notes Radiator Core Removal & Water Distrib. Tube data.*
Water Pump:—Packless type with grease fitting. *For complete data, refer to 1941 Mech. Equip. Index.*
Thermostat:—Bishop & Babcock or Fulton (Fulton only on P11). Starts to open 157-162° F. Fully open 183°.

CLUTCH:—Borg & Beck Model 9A7, 11A6 (Taxi) with 'Borglite' driven member. #955 (9A7), #931 (11A6) stamped on cover. Single plate, dry disc types. *For complete data, refer to 1941 Mech. Equip. Index.*
Facings—Molded-Woven, 2 used. I.D. 6" (9A7), 6½" (11A6). O.D. 9¼" (9A7), 11" (11A6). Thickness ⅛".
Adjustment:—Pedal should just clear toeboard (adjust stopscrew an lower end of pedal & have 1" free travel (adjusting nut on connector link at fork).
Removal:—Remove release fork pull-back spring, transmission (see Transmission) and housing underpan. Disconnect release fork from pivot, pull out release bearing and sleeve. Mark cover and flywheel. Take out cover screws evenly, remove assembly.

TRANSMISSION:—Own Make. All helical gear, constant-mesh, synchro-mesh (second and high), sliding gear (low and reverse) with remote shift. *For complete data, refer to 1941 Mech. Equip. Index.*
Transmission Control:—Steering column shift. Manual type Std. Power Shift (vacuum type) Opt'l. *For complete data, refer to 1941 Mech. Equip. Index.*
Removal:—Jack up front end of car, disconnect front universal (loosen companion flange nut if disassembling transmission—see Chrysler Shop Notes for Propeller Shaft Center Bearing Removal on 7 pass.). Disconnect speedometer cable, hand brake cable, gear-shift rods, vacuum and air hose (if Power Shift used). Remove trans.-to clutch housing capscrews and nuts. Pull unit to rear, down and out of car.

UNIVERSAL JOINTS:—Detroit-Universal Series 4200 (3 & 5 pass.), Series 7200 (7 pass.). Roller bearings, ball and trunnion type (4200), cross type (7200). *For complete data, refer to 1941 Mech. Equip. Index.*
Propeller Shaft Center Bearing:—Used on 7 passenger sedans. *See Chrysler Shop Notes for servicing.*

REAR AXLE:—Own Make. Semi-floating, Hypoid gears with Hotchkiss drive. *Refer to Mech. Equip. Index.*
Ratio—**3.73-1** (P11, 12 Econ.), **3.9-1** (P11 Coupe), **4.1-1** (P11 Sedan, P12 Coupe exc. Conv.), **4.3-1** (P12 5 & 7 pass. Sedans, Conv. Coupe), **4.56-1** (P11, 12 6.00x18" tires). **Backlash** .006-.010". Screw adjustmet.
Removal:—Disconnect rear universal, remove axle shafts (see below) and carrier assembly cap screws.
Axle Shaft Removal—Remove wheel, hub, and drum assembly (use screw type hub puller—Tool C-319), block brake pedal, disconnect brake line at wheel cylinder, take off backing plate with oil seal, pull shaft and bearing (using Tool C-158).
Wheel Bearing Adjustment:—Shims between backing plate and axle housing. With wheel and hub removed, check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .010", .0125", .015", .030" thick) equally at both wheels. **Endplay**—.003-.008".

SHOCK ABSORBERS:—Delco—Direct Acting (Dom. & Exp.), Adjustable Direct Acting (Dom. 20" wheels, Export). *For data, refer to Mech. Equip. Index.*

STEERING:—Steering Gear—Chrysler (Gemmer design Models 305, 335—7 passenger) worm-and-roller with 'push-pull' adjustment. See Gemmer. *For complete data, refer to 1941 Mech. Equip. Index.*
Front Suspension:—Independent, linked parallelogram type & coil springs. *Refer to Mech. Equip. Index.*
Kingpin Inclination—4¾° to 6°.
Camber—Positive ¼°. Limits 0° to Pos. ¾°.
Caster—Negative 1° to Positive 1°. Not adjustable.
Toe In—1/16" (0-⅛"). Turn both rods equally.
Steering Geometry—Inner wheel 22°0'. Outer 20°.

BRAKES:—Service. Lockheed hydraulic, double anchor type. Hand lever applies independent shaft brake. *For complete data, refer to 1941 Mech. Equip. Index.*
Drums—10" centrifuse, 11" (7 passenger).
Lining—Molded asbestos. 2" wide, 13/64" thick. Length per shoe: Front—10 5/16", 11 15/32" (Seven passenger); Rear—7 11/16", 7 31/32" (7 passenger).
Clearance—.012" Toe (top), .006" Heel, for each shoe.
Hand Brake:—On drum at rear of transmission.
Adjustment—*See Chrysler Shop Notes for instructions.*
Drum—Cast-iron. Diameter 6".
Lining—Width 2". Thick. 5/32". Length 17 1/16".

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

HOOD LOCK:—Hood is Alligator type with instrument panel lock control button. To raise hood, pull out on control knob under instrument panel (hood will raise slightly), press up on safety catch tab (under front edge of hood) to release safety catch, raise hood. NOTE—When working on front of car, hood lock can be released without operating lock control button by inserting 8" screwdriver between first and second radiatior grille bars on right side so that point of screwdriver is engaged between hood catch lever and front of bracket to pry lever so as to release catch.

Hood Lock Adjustment—If lock control button requires considerable effort to release catch, or if hood must be slammed to engage lock, lubricate all parts of lock mechanism. If this does not correct trouble, adjust lock pilot stud by loosening locknut on upper end of stud and turning stud in or out (lower end of stud slotted for screwdriver). Check operation and make certain that stud locknut tightened securely.

HOOD REMOVAL & INSTALLATION:—Before removing hood, mark location of hinge on cowl (scribe around hinge with pointed tool) so that hinge can be re-installed in exact same position. Use pry bar to remove hood hinge springs, remove two bolts from hood hinge assembly at right and left side of cowl, remove hood. Hood panels can be dismantled by removing center silver streak and then taking out 14 sheet metal screws holding panels together. Re-install hood in same manner.

Hood Fitting—If hood does not fit tightly at cowl, loosen hood hinge to cowl bolts slightly and drive hinge down, tighten hinge bolts. When installing new hinges, install hinge on cowl, note alignment and whether hinge binds with mounting bolts tight. Shim with washers installed between bracket and cowl, if necessary, so that hinge operates freely, then bolt hinge to hood.

POWER PLANT (ENGINE & TRANSMISSION) REMOVAL:—Drain radiator and cylinder block, remove hood. Remove Front Fenders and Radiator as a unit (see above). Disconnect and remove selector control rod from transmission, disconnect shifter lever from transmission shifter shaft. Disconnect fuel line at pump, oil pressure gauge line, windshield wiper tube, throttle control rods, temperature gauge engine unit, engine ground strap and all wiring, speedometer cable at transmission, clutch control bracket at flywheel housing, clutch throw-out fork, exhaust pipe at manifold. Disconnect rear universal joint, remove propeller shaft (withdraw shaft from transmission). Disconnect front engine support by taking out two bolts. Attach chain hoist to engine, remove bolts from rear engine mountings, lift engine free of rear support crossmember, pull engine and transmission assembly forward and remove from frame. Re-install in same manner using new exhaust pipe gaskets. Adjust clutch pedal free travel, Safety Shift adjustments, and throttle linkage after engine installed.

FRONT FENDER AND RADIATOR ASSEMBLY REMOVAL:—To facilitate work on front of engine, remove fenders and radiator as an assembly as follows: Drain radiator, disconnect hoses, remove front bumper assembly, hex head fender-to-body bolts, Fender-to-frame brace bolts, headlamp wires from top side of fender apron and headlamp terminal at body side of terminal, right headlamp wires from back of terminal on right fender side apron, wire harness from radiator, and 2 nuts from beneath radiator support. Lift front end assembly off

FRONT ENGINE INSULATOR REMOVAL:—Remove splash shields in back of radiator, disconnect exhaust pipe, remove two bolts from front engine to mounting support, jack engine up enough at front end for access to insulator. Clean dirt off mounting from below, remove two screws holding mounting on frame, remove mounting. Re-install in same manner and tighten all mounting bolts securely.

RADIATOR CORE REMOVAL:—Drain cooling system, disconnect radiator hoses, take out 3 capscrews at each side of radiator core and tip fan shroud back against front of engine. Lift radiator core up and out of shell, rotating the fan to clear the radiator water outlet connection. Re-install radiator in same manner.

Water Distributing Tube Servicing—Consists of a metal tube installed in the engine block with closed end toward rear of engine which distributes cooling water through block. If engine overheats, check tube for corrosion or rust and replace tube. Install tube with closed end toward rear.

OIL PAN REMOVAL (Eight Only):—For access to attaching screws at front end of pan, remove radiator splash aprons as follows: Remove screws attaching aprons to front cross-member and radiator support, remove aprons from inside engine compartment by lifting aprons out with a circular motion (rotate right apron to right, and left apron to left, as they are being lifted out).

ORIGINAL BORE & PISTON SIZES:—Original bore sizes, and size of piston installed in each cylinder bore, may be determined by letter stamped on piston head and on top face of cylinder block as listed below. Piston sizes graduated in five .0005" steps as follows:

Piston & Engine Mark:	Six—Piston Size	Eight
'A'	3.5605"	3.247"
'B'	3.561"	3.2475"
'C'	3.5615"	3.248"
'D'	3.562"	3.2485"
'E'	3.5625"	3.249"

REPLACEMENT PISTONS:—**Standard**—Pistons furnished in following sizes for replacement of Standard Production Pistons listed above. Sizes and part numbers for each model are as follows:

Part No. — Six — Size		Part No. — Eight — Size	
505036	3.5605"	503048	3.247"
505037	3.5615"	503049	3.248"
505038	3.5635"	503050	3.249"

First size covers 'A' and Low Limit 'B' production pistons. Second size covers High Limit 'B', all 'C', and Low Limit 'D' pistons. Third size covers High Limit 'D' and all 'E' pistons.

Oversize Replacement Pistons:—Finished pistons furnished in following oversizes: .005", .010", .020", .030". NOTE—All factory replacement pistons held to uniform weight within 1/16 oz. and all oversize pistons up to .030" oversize are same weight as standard pistons.

PISTON PIN FITTING:—Pins case-hardened & ground (out-of-round .0002" max.). To install pins, coat inside of piston bosses with graphite grease, insert slotted end of pin in lockscrew boss and press in place. Pressure to install pin in piston should be 200-300 lbs. Car manufacturer recommends use of following tools (in conjunction with arbor press): hydraulic cylinder & gauge (J-1325-SA-1), piston rest block (J-1325-1), piston pin remover (J-1325-2), piston skirt plug (J-1325-3).
NOTE—On 1941 engines, pins installed with slot to one side (toward bottom on previous models) and new self-locking pin lockscrew is used.

PISTON PIN BUSHING:—**New Type Service Bushings**—New type aluminum bronze bushings which are more resistant to corrosion furnished for service as follows: Part No. 505320 (6 Cyl. beginning 1935), 505321 (8 Cyl. beginning 1933). These bushings may be distinguished from previous bronze type by lighter color and less coppery appearance (bushings darken and may require polishing or buffing to bring out difference in color).
Installation—Press bushings in place, making sure that 3/32" groove between bushings aligned with oil hole in rod. Then burnish bushings securely in place with burnishing bar. Then accurately hone bushing for .0003-.0005" clearance on pin. Car manufacturer recommends use of following tools for servicing pin bushings: J-540-1—Bushing Remover. J-540-2—Bushing Replacer (tool fitted with shoulder which prevents bushings from being pressed too far in or from collapsing while being installed), J-516 Burnisher Bar, and J-526 Burnisher Block. NOTE—These tools are used in conjunction with an arbor press using the J-526 Burnisher Block as a support for the rod on the press.

CONNECTING ROD LOWER BEARING:—Removable type. No adjustment. Shims should not be used or bearing caps filed. When replacing bearings check crankpins. If scored or out-of-round and taper exceeds .001" crankshaft should be replaced.
Fitting—Use .0015" brass shim ½" wide and ⅞" long. Remove cap and lay shim across bearing. Tighten cap (with shim in place). Check bearing fit as follows:—Rod should be locked when testing end movement by hand but should slide on crankpin when tapped lightly with hammer (if rod can be moved by hand, install .001" undersize bearing). Rod should move freely on pin with shim removed.
Installation—Bearing shells fitted with tangs (Six—one to each edge of bearing, Eight—two on each edge). Install cap with tangs on opposite sides of rod (Six), on opposite ends of crankpin (Eight).

MAIN BEARINGS:—**Removal.** Bearings can be removed with caps removed and crankshaft in place by inserting suitable tool (see NOTE following) in oil hole in shaft and rotating shaft in usual direction.
NOTE—Bearing Removal Tool can be made from ⅛"x1½" cotter key. Bend each end of key up 5/16" to make ⅝" long base. With this as a base, bend key to form 59° angle. With this tool inserted in place end will just protrude far enough to engage bearing.
Installation—Insert plain edge of bearing in indented side of bearing support, slowly rotate crankshaft until bearing seated.

FITTING MAIN BEARINGS:—If the crankshaft is badly scored manufacturer recommends that it be replaced. To check bearing fit, use .002" brass shim ½" wide and 1" long. With cap removed place shim across bearing. Tighten cap (with shim in place). Test bearing fit by rocking flywheel by hand. **Do**

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

not rock flywheel more than 1" in either direction or bearing may be damaged by shim. If crankshaft locks with shim in place and rotates freely with shim removed bearing size correct. If shaft moves with shim in place use .001" undersize bearing. IMPORTANT—Do not file main bearing caps. These caps are not furnished separately.

REAR MAIN BEARING OIL SEAL (Six only):—Consists of oil slinger on crankshaft to rear of rear main bearing operating in groove formed in block and cap (drain hole in cap returns oil to crankcase) with asbestos seal fitted in separate groove at rear.
Installation—With crankshaft out of engine and bearing shells removed, press packing in rear groove in block, seat packing using Tool J-1045 (large diameter to front of engine) by tapping tool with lead or rawhide hammer. With tool in place, cut each end of seal flush with bearing cap seat. Repeat operation for cap. Install crankshaft & bearings.

HARMONIC BALANCER:—Replace for service.
Removal & Installation—Can be removed from under car without removing front assembly. Use a 13/16" socket wrench to remove the retaining screw, remove balancer. NOTE—If balancer corroded on crankshaft, remove Front Assembly and use Puller J-496.

CAMSHAFT:—Removal—Remove Front Fender and Radiator Assembly (see above), remove fan belt, fan, and harmonic balancer (use Puller J-496). Support front end of engine with jack and remove front engine support (see Front Engine Insulator Removal above), remove timing chain cover, chain, and sprockets. Remove cylinder head and valve covers, take out valves and lifters (lifters are barrel type and can be removed from above with valves out). Remove oil pump, fuel pump, and distributor. Take out screws and remove camshaft thrust plate, withdraw camshaft at front of engine. Re-install camshaft in same manner making certain that timing chain cover is properly centered (see Timing Chain Cover and Oil Seal data below). After camshaft installed, check Valve Timing, Ignition Timing, and Tappet Clearance.

Bearing Servicing—Use special tool J-550 to remove and install camshaft bearings (rear bearing on Eight must be pulled out toward front as expansion plug at rear prevents driving on bearing from rear). Use driver to install all bearings making certain that oil hole in bearings is lined up with hole in block (holes are at bottom of bearings). Then line ream all bearings to finished sizes as follows:

Bearing Finished Size:	Six	Eight
#1 (Front)	1.9950-1.9955"	1.9950-1.9955"
#2	1.9937-1.9642"	1.9637-1.9642"
#3	1.9325-1.9330"	1.9325-1.9330"
#4	1.9012-1.9017"	1.9012-1.9017"
#5		1.8700-1.8705"

TIMING CHAIN COVER & OIL SEAL:—Consists of a cork seal and spring assembled on the crankshaft in front of the chain sprocket so that the cork bears against the inner face of the timing chain cover.

Installing New Cork Seal—Coat seal with graphite lubricant, rubbing lubricant well into the face of the cork, before installing seal in engine. This lubrication necessary to prevent noise developing at this point.

Installing Timing Chain Cover—Use J-546 tool to center timing chain cover before cover screws are tightened.

OIL PUMP SERVICING:—Pump Removal & Installation—Turn crankshaft so that #1 piston on top dead center of compression stroke with distributor rotor at #1 firing position. Remove steering idler arm and right hand engine side pan. Take out pump mounting bolts and remove pump. When installing pump, see that prick punch mark on pump is down, install pump without disturbing distributor shaft position, recheck Ignition Timing.
Pump Specifications—Pump shaft bearing clearance .0005-.002". Shaft and body end clearance .002-.006". Idler gear bearing clearance .0005-.002". Driving gear backlash .003-.004". Driving gear and idler gear backlash .006-.008". Driving gear and idler gear clearance .002-.006".
Pressure Relief Valve—New type. Consists of a spring-loaded disc valve located in the pump body beneath the idler gear. When pressure exceeds 40 lbs., disc is forced off its seat and oil is by-passed back to inlet side. Valve is not adjustable.

CRANKCASE OIL CLEANER:—New Pontiac type 'controlled flow' design consisting of settling chamber built in the oil inlet and filter screen housing in the crankcase. With this design, oil drawn in through the fine-mesh filter screen flows up through inlet pipe and down in settling chamber (concentric with the inlet pipe) until direction is sharply reversed by flat baffle in chamber. This reversal of flow causes dirt particles to be thrown out of the oil and settle in the bottom of the chamber (baffle prevents dirt accumulation in chamber being disturbed or picked up by oil).
Servicing—No servicing required but Oil Cleaner should be removed and settling chamber cleaned out when oil pan removed for other work, or if car has been upset or turned over so that sediment in chamber disturbed.
Oil Cleaner Removal & Installation—To remove cleaner with oil pan off engine, disconnect oil suction pipe from crankcase as a unit. Take out attaching screws and remove cleaner from bracket and suction pipe. Remove snap ring on bottom of cleaner and remove oil screen. Take out ten screws which mount cleaner head in housing shell, remove settling chamber from housing shell. Wash all parts in gasoline and scrape sediment from settling chamber. When reassembling cleaner, see that all gaskets in good condition or use new gaskets, turn head and housing shell upside down, insert two screws and place gasket inside shell, then set settling chamber in place and start screw threads, turn assembly right side up and install remainder of screws, tighten all screws securely. Install strainer, snap ring, and suction pipe.

OIL FILLER CAP & CRANKCASE VENTILATOR CLEANER:—All oil filler caps (Std. & Heavy Duty type) serve as inlet for crankcase ventilating system and must be correctly installed on engine. Install cap **with seam on side engaging groove in top of oil filler pipe** and opening in cap toward fan. Service filler cap and crankcase outlet cleaner (heavy duty) as follows:
Standard Filler Cap—Inspect at 1000 mile intervals and clean when necessary. Wash copper gauze filter element in gasoline and re-oil by dipping in engine oil before re-installing.
Heavy Duty Filler Cap—Used on cars with heavy duty (oil bath) type carburetor air cleaner. Similar to standard cap except for generator cleaning capacity. Service in same manner as standard cap and always clean outlet pipe air cleaner at same time.
Crankcase Ventilator Outlet Pipe Air Cleaner—Consists of a copper gauze filtering element in an elbow on the crankcase outlet pipe. Clean in same manner as filler cap (above). NOTE—No outlet pipe cleaner used on cars with Standard Filler Cap and oil-wetted type carburetor air cleaner.

1940 & PREVIOUS MODELS

CRANKCASE VENTILATOR OUTLET PIPE CLEANER (1940 MODELS):—The small filter element installed in lower end of crankcase ventilator outlet pipe should be removed and discarded (this cleaner will restrict outlet and interfere with crankcase ventilation if not serviced regularly). NOTE—For cars operated in extremely dusty territory, manufacturer recommends that 1941 type Heavy Duty outlet pipe and filter (see 1941 data above) be installed on 1940 cars.

CRANKCASE OIL CLEANER (1941 TYPE) INSTALLATION ON PREVIOUS MODELS:—The 1941 type built-in permanent oil cleaner can be installed on 1939-40 Six Cylinder, and 1940 Eight Cylinder cars to replace regular inlet screen. See 1941 Crankcase Oil Cleaner data (above) for installation directions.

CAMSHAFT SPROCKET REPLACEMENT (1937-39):—Eight Cylinder Models Only—On all eight cylinder engines for 1937, 1938, and 1939 before Engine No. 8-188892; a camshaft sprocket with a short hub and a spacer washer was used. New type camshaft sprocket, Part No. 503454, is furnished for service and when this new sprocket installed on above cars, **spacer washer should be discarded.**

REAR AXLE OIL SEAL LEAKS:—Rear axle oil leaks may develop due to oil passing by axle shaft oil seal outer edge and working through between rear wheel bearing retainer and flange of axle housing and down onto brake lining. To correct this condition, coat axle housing shaft oil seal seat with sealing material (Permatex or Permagasket) before installing seal and also coat both sides of rear brake oil deflector gasket.

ACCELERATOR PEDAL STICKING:—Will cause engine to idle or run faster than normal. To correct this complaint, enlarge bolt holes in accelerator pedal cross-shaft mounting brackets with portable drill so brackets will align with shaft when reinstalled. Oil shaft at regular lubrication periods. Check to see that pedal rod has clearance at hole in toeboard and that rubber bellows on rod is not jammed in toeboard hole. On Torpedo 8, make certain that correct accelerator pedal #504294 (9⅜" long) installed. If Deluxe pedal (10 3/16" long) installed on this model, pedal will jump off studs.

CLUTCH PEDAL RATTLE CORRECTION:—Due to end-play in countershaft and lever as pedal depressed caused by shrinkage of felt at each end of shaft. To correct, leave felts on but install extra felt No. 502099 on frame end of shaft and soak all felts in engine oil. IMPORTANT—Felts should be oiled at each lubrication period to prevent squeaks.

CLUTCH PILOT BUSHING:—New clutch pilot bushing #412562 (oilless type) available for 1935 to 1940 cars. This can be used in place of regular production roller bearing where hole in crankshaft worn. Bushing can be driven into worn hole to give snug fit and provides a smooth running surface for shaft.
Installation—Soak bushing in light engine oil, place bushing on end of driver (Tool J-1329-P), insert tool through hole in flywheel housing and drive bushing in place making certain that it bottoms in hole. Manipulate driver out of bushing. NOTE—Clutch pilot bushing remover (Tool J-1448-1) available for bushing removal.

HOOD FITTING, HOOD LOCK ADJUSTMENT, AND FRONT FENDER & RADIATOR REMOVAL:—*See Pontiac Shop Notes for instructions.*

SERIAL NUMBER:—On plate on left side of dash under hood. 1st nos.:

	Pontiac	California	Linden
Deluxe 41-25	P6JA-1001	C6JA-1001	L6JA-1001
Str mlnr. 41-26	P6JB-1001	C6JB-1001	L6JB-1001
Custom 41-24	P6JC-1001	C6JC-1001	L6JC-1001

ENGINE NUMBER:—First number 6-761501. Stamped on boss left front corner of engine block.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3 9/16". **Stroke**—4". **Displacement**—239.2 cu. ins. **Rated HP**—30.4. **Developed Horsepower**—90 at 3200 RPM (Std. hd.). **Compression Ratio**—6.5-1 Std., 7.5-1 HC Optl. **Compression Pressure**—155 lbs. (Std.), 179 (HC hd) @ 1000 RPM (approx. 118-120 lbs., cranking spd. Std. hd). **Vacuum Reading**—Steady 18-20" idling at 7-8 MPH. *See Pontiac Shop Notes for Power Plant Assembly and Front Engine Insulator Removal.*

PISTONS:—Electro-plated, chrome nickel alloy iron. Cannot be ground. **Length** 3 19/32". **Weight** 27 ozs. Piston & pin and rod weight variation 1/16 oz. max. **Removal**—Pistons and rods removed from above. **Clearance**—Top land .0175-.0315". Skirt .002".

Original Bore & Piston Sizes, Replacement Pistons:—*See Pontiac Shop Notes for sizes and markings.*

Fitting New Pistons:—Insert .0015" x ½" feeler between piston and cylinder wall. Pull to withdraw feeler must be 10-20 lbs. Taper and out-of-round limits—Piston .0005", Cylinder .0005" max. new.

PISTON RINGS:—Two taper faced compression rings above pin, one slotted oil ring below pin. NOTE—Install compression rings with mark TOP up.

Ring	Width	End Gap	Side Clearance
Compression	.0930-.0935"	.009-.014"	.0015-.003"
Oil Control	.1860-.1865"	.007-.017"	.001-.0025"

Replacement Rings:—Oversizes .005", .010", .020", .030".

PISTON PIN:—**Diameter**—15/16". **Length**—3 1/16". Pin locked in one piston boss (new self-locking lock-screw used). Free end slotted (slot on side rather than bottom as on preceding models). **Pin Fit in Piston**—*See Pontiac Shop Notes for data.* **Pin Fit in Rod Bushing**—.0003-.0005" clearance.

Replacement Pins:—.001" (red & brown), .003" (red), .005" (blue) oversize. Paint marked on end of pin.

CONNECTING ROD:—**Weight** 2.31 lbs. **Length** 7 9/16". **Piston Pin Bushing (Upper Bearing)**—Split aluminum bronze bushings. *See Pontiac Shop Notes for data.* **Lower Bearing Diameter**—2⅛". **Lower Bearing**—New thin type, interchangeable, steel-backed, white bearing metal alloy. Furnished standard size and .001" undersize. **Clearance**—.0005-.0015" (new). **Endplay**—.005-.010".

Bearing Adjustment:—None (no shims). *See Pontiac Shop Notes for Fitting and Installing Bearings.*

Installing Rods:—Not offset (install either way). NOTE—Self-locking rod bolt nuts used.

CRANKSHAFT:—4 bearing, integral counterweights. *See Pontiac Shop Notes for Harmonic Balancer Removal and Rear Main Bearing Oil Seal Renewal.* **Bearing Diameters**—#1, 2½"; #2, 2 17/32"; #3, 2 19/32"; #4, 2⅝". **Bearings**—New thin type, steel-backed, white bearing metal alloy. Upper & lower halves alike. Furnished Std. & .001" undersize. **Clearance** .001-.003".

Bearing Adjustment:—None (no shims). *See Pontiac Shop Notes for Removal and Fitting of Bearings.*

End Thrust:—At #3 bearing. **Endplay**—.003-.008".

CAMSHAFT:—4 bearing. Non-adjustable chain drive. *See Pontiac Shop Notes for Camshaft Removal, Bearing Finished Sizes and Timing Cover Oil Seal data.* **Bearing Diameters**—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 29/32". **Bearings**—Steel-backed, babbitt-lined bushings. **Clearance**—.0015-.0025" (new).

End Thrust:—Steel thrust plate behind camshaft sprocket. Replace if worn. **Endplay**—.002-.005".

Timing Chain:—Morse Type C-1882K (No. 1532). Width 1". Pitch ⅜". Length 21" or 56 links.

Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 19/32"	.310-.311"	5.718"
Exhaust	1 15/32"	.310-.311"	5.718"

	Seat Angle	Lift	Stem Clearance
Intake	30°	19/64"	Free fit to .0006"①
Exhaust	45°	19/64"	Free fit to .0006"①

① Guides tapered (.0006" max. clearance at bottom).

Tappet Clearance:—.011-.013" all valves (engine warm). Use .011" feeler as 'go' gauge, .013" as 'no go'. NOTE—Car manufacturer recommends .013" exhaust clearance for sustained high speed driving.

Valve Guides:—Removable, tapered guides (.001" taper to the inch with greatest clearance at top). IMPORTANT—Measure clearance at bottom end. Valve should just fall through guide of own weight when started in guide. NOTE—Guides should be cleaned with Tool KMO-122 valve guide cleaner (blade type). Service guides straight cut, install guides (ream to fit valve stems with reamer P.R. 131).

Valve Springs:—Intake and exhaust springs identical. Install with two closed coils at top and dampener on top of each spring. Use new dampeners whenever removed from spring. **Free Length**—2 9/16".

	Spring Pressure	Spring Length
Valve Closed	56-63 lbs.	1 29/32"
Valve Open	97-105 lbs.	1 19/32"

Valve Lifters:—Barrel type, cast-iron. Guide holes reamed in block. Lifters furnished .005" oversize (use pilot reamer J-706-P when reaming holes to maintain alignment). **Clearance**—Free fit. Lifter should just move freely with finger touch.

Valve Timing:—See Camshaft Setting above. **Intake Valves**—Open 5° BTDC. Close 39° ALDC. **Exhaust Valves**—Open 45° BLDC. Close 5° ATDC. **Valve Timing Check**—With .015" tappet clearance #6 intake valve should open with #6 piston 5° or .0096" before top dead center with first straight line of flywheel mark '/IGN.ONE/' slightly past indicator in left front face of flywheel housing. Reset tappet clearance .011-.013" (warm).

LUBRICATION:—Pressure (pump on right of engine). *See Pontiac Shop Notes for Oil Pump servicing and new type Pontiac (built-in) Oil Cleaner servicing.* **Normal Oil Pressure:**—35-40 lbs. with warm oil. **Oil Pressure Regulator:**—On pump. Opens at 40 lbs. Non-adjustable type. **Crankcase Capacity:**—6 qts.

COOLING SYSTEM:—**Capacity**—18 qts. *See Pontiac Shop Notes Radiator Core Removal & Water Distr. Tube data.* **Pressure Valve**—In filler cap. Opens at 3¾ lbs.

Water Pump:—Packless, sealed ball-bearing type. *For complete data, refer to 1941 Mech. Equip. Index.*

Thermostat:—Harrison. In cylinder head outlet. **Setting**—Starts to open 151° F. Fully open 173° F.

Temperature Gauge:—AC Electric. No. 1511053 (Dash Unit), No. 1510772 (Engine Unit). *For complete data, refer to 1941 Mech. Equip. Index.*

CLUTCH:—**Inland.** 'Diaphragm' type, single plate, dry disc type with Long 9CF-TS, No. CM-5250; 10CF-CS, No. CM-5122 (Taxi) driven member. *For complete data, refer to 1941 Mech. Equip. Index.* **Facings** Moulded, 2 used. Inside Diam. 6" (all). Outside Diam. 9⅛", 10" (Taxi). Thickness .125".

Pedal Adjustment:—Free travel ⅞-1⅛" (adjusting nut on link at clutch fork). Pedal height to lower face of pedal should be 4¾" (41-25), 5 3/16" (others). Adjust stopscrew at lower end of pedal arm.

Removal:—Remove transmission (see below), take off bottom housing cover and control shaft inner bracket. Disconnect pedal pull-back spring. Remove fork ball support, fork, and throwout bearing. Paint mark cover and flywheel (locating pin in flywheel discontinued) and reassemble to these marks to maintain balance. Remove cover bolts evenly until tension relieved. Move clutch away from flywheel at bottom to remove disc, lower assembly out of car.

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote shift. *For complete data, refer to 1941 Mech. Equip. Index.*

Transmission Control:—Pontiac 'Safety-Shift' type. NOTE—Single shifter rod (replacing 2 rods and idler) used on late 41-24, 41-26 and for replacement. *For complete data, refer to 1941 Mech. Equip. Index.*

Removal:—Disconnect speedometer cable, gearshift selector and control rods from transmission. Disconnect rear universal (wire trunnions) and pull out propeller shaft. Remove upper transmission mounting screws, install guide pins (J-851), remove lower screws, pull transmission to rear and lower out of car.

UNIVERSAL JOINTS:—**Mechanics 2C or 2CR (new type).** Roller bearing types. *For complete data, refer to 1941 Mech. Equip. Index.* NOTE—1 piece driveshaft used. Slip joint formed at rear of transmission ahead of front universal.

REAR AXLE:—**Own Make.** Semi-floating, Hypoid gear type with Hotchkiss drive. *For complete data, refer to 1941 Mech. Equip. Index.* **Ratio**—4.3-1 (white) 41-24, 41-26. 4.1-1 (green) 41-25. 3.9-1 (red) Economy. 4.55-1 Heavy Duty (yellow). Color marked on end of right axle shaft. **Backlash**—.003-.012" (new), slightly over .012" (worn).

Removal:—Disconnect rear universal and wire trunnions (do not disengage spline joint at transmission), remove axle shafts and carrier flange capscrews.

Axle Shaft Removal:—Remove wheel, brake drum, 4 backing plate bolt nuts, static collector, and loosen bearing retainer (do not move backing plate or brake line may be damaged). Pull shaft with puller J-942 (do not drag axle shaft on oil seal). **Wheel Bearing Adjustment**—None.

SHOCK ABSORBERS:—**Delco.** FRONT—Model 1947-C (right), D (left). REAR—1024-V (Domestic). Double acting, hydraulic (1024-V direct acting). *For complete data, refer to 1941 Mech. Equip. Index.*

STEERING:—**Steering Gear** Saginaw worm-and-roller. *For complete data, refer to 1941 Mech. Equip. Index.*

Front Suspension:—Independent, linked parallelogram (coil spring) type. *Refer to Mech. Equip. Index.* **Kingpin Inclination**—4⅜° to 4⅞°. **Caster**—Negative ¾°. Limits Neg. ½° to Neg. 1°. **Camber**—0° preferred. Limits Neg. ¼° to Pos. ¼°. **Toe In**—0-1/16". Adjust tie rod tubes equally. **Steering Geometry**—Inner wheel 23° ± ½°. Outer 20°.

BRAKES:—**Service.** Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes. *For complete data, refer to 1941 Mech. Equip. Index.* **Wheel Cylinder Bore**—Front wheel 1". Rear 15/16". **Drums**—Steel (nickel alloy iron liner). Diameter 11". **Lining**—Moulded. Width 1¾". Thickness 3/16". Length 9 11/32" (Primary shoe—D-R Multibestos), 11 31/32" (Secondary shoe—L-8 Multibestos). **Clearance**—.015" at both ends of secondary shoe with primary shoe forced out against drum.

Hand Brake:—See Service Brakes above.

HOOD FITTING, HOOD LOCK ADJUSTMENT, AND FRONT FENDER & RADIATOR REMOVAL:—*See Pontiac Shop Notes for instructions.*

SERIAL NUMBER:—On plate on left side of dash under hood. 1st nos.:

	Pontiac	California	Linden
Deluxe 41-27	P8JA-1001	C8JA-1001	L8JA-1001
Str'mlnr. 41-28	P8JB-1001	C8JB-1001	L8JB-1001
Custom 41-29	P8JC-1001	C8JC-1001	L8JC-1001

ENGINE NUMBER:—First number 8-246501. Stamped on boss on left front corner of engine block.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head type. **Bore**—3¼". **Stroke**—3¾". **Displacement**—248.9 cu. ins. **Rated HP**—33.8. **Developed Horsepower**—103 at 3500 RPM (Std. hd.). **Compression Ratio**—6.5-1 Std., 7.5-1 HC Optl. **Compression Pressure**—155 lb. (Std.), 175 (HC hd.) @ 1000 RPM (approx. 118-120 lbs., cranking spd. Std. hd.). **Vacuum Reading**—Steady 18-20" idling at 7-8 MPH. *See Pontiac Shop Notes for Power Plant Assembly, Front Engine Insulator and Oil Pan Removal.*

PISTONS:—Electro-plated, chrome nickel alloy iron. Cannot be ground. **Length** 3 19/32". **Weight** 24⅝ ozs. Piston & pin and rod weight variation 1/16 oz. max. **Removal**—Pistons and rods removed from above. **Clearance**—Top land .0175-.0295". Skirt .002". **Original Bore & Piston Sizes, Replacement Pistons:**—*See Pontiac Shop Notes for sizes and markings.* **Fitting New Pistons:**—Insert .0015" x ½" feeler between piston and cylinder wall. Pull to withdraw feeler must be 10-20 lbs. Taper and out-of-round limits—Piston .0005", Cylinder .0005" max. new.

PISTON RINGS:—Two taper faced compression rings above pin, one slotted oil ring below pin.

NOTE—Install compression rings with mark TOP up.

Ring	Width	End Gap	Side Clearance
Compression	.0930-.0935"	.009-.014"	.0015-.003"
Oil Control	.1860-.1865"	.007-.017"	.001-.0025"

Replacement Rings:—Oversizes .005", .010", .020", .030".

PISTON PIN:—Diameter—15/16". **Length**—2⅞". Pin locked in one piston boss (new self-locking lock-screw used). Free end slotted (slot on side rather than bottom as on preceding models). **Pin Fit in Piston**—*See Pontiac Shop Notes for data.* **Pin Fit in Rod Bushing**—.0003-.0005" clearance. **Replacement Pins:**—.001" (red & brown), .003" (red), .005" (blue) oversize. Paint marked on end of pin.

CONNECTING ROD:—Weight 1.98 lbs. **Length** 7 9/16". **Piston Pin Bushing (Upper Bearing)**—Split aluminum bronze bushings. *See Pontiac Shop Notes for data.* **Lower Bearing Diameter**—2". **Lower Bearing**—New thin type, interchangeable, steel-backed, white bearing metal alloy. Furnished standard size and .001" undersize. **Clearance**—.0005-.0015" (new). **Endplay**—.005-.010". **Bearing Adjustment:**—None (no shims). *See Pontiac Shop Notes for Fitting and Installing Bearings.* **Installing Rods:**—Not offset (install either way). NOTE—Self-locking rod bolt nuts used.

CRANKSHAFT:—5 bearing, integral counterweights. *See Pontiac Shop Notes for Harmonic Balancer Removal.* **Bearing Diameters**—#1, 2⅜"; #2, 2 13/32"; #3, 2 7/16"; #4, 2 15/32"; #5, 2½". **Bearings**—New thin type, steel-backed, white bearing metal alloy. Upper & lower halves alike. Furnished Std. & .001" undersize. **Clearance** .001-.003". **Bearing Adjustment:**—None (no shims). *See Pontiac Shop Notes for Removal and Fitting of Bearings.* **End Thrust:**—At #4 bearing. **Endplay**—.003-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive. *See Pontiac Shop Notes for Camshaft Removal, Bearing Finished Sizes and Timing Cover Oil Seal data.* **Bearing Diameters**—#1, 2"; #2, 1 31/32"; #3, 1 15/16"; #4, 1 29/32"; #5, 1⅞". **Bearings**—Steel-backed, babbitt-lined bushings. **Clearance**—.0015-.0025" (new). **End Thrust:**—Steel thrust plate behind camshaft sprocket. Replace if worn. **Endplay**—.002-.005". **Timing Chain:**—Morse Type 766-T (No. 2660). Width ¾". Pitch ⅜". Length 21" or 56 links. **Camshaft Setting:**—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	.310-.311"	5.53"
Exhaust	1 11/32"	.310-.311"	5.53"

	Seat Angle	Lift	Stem Clearance
Intake	30°	19/64"	Free fit to .0006"①
Exhaust	45°	19/64"	Free fit to .0006"①

① Guides tapered (.0006" max. clearance at bottom).

Tappet Clearance:—.011-.013" all valves (engine warm). Use .011" feeler as 'go' gauge, .013" as 'no go'. NOTE—Car manufacturer recommends .013" exhaust clearance for sustained high speed driving. **Valve Guides:**—Removable, tapered guides (.001" taper to the inch with greatest clearance at top). IMPORTANT—Measure clearance at bottom end. Valve should just fall through guide of own weight when started in guide. NOTE—Guides should be cleaned with Tool KMO-122 valve guide cleaner (blade type). Service guides straight cut, install guides (ream to fit valve stems with reamer P.R. 131). **Valve Springs:**—Intake and exhaust springs identical. Install with two closed coils at top and dampener on top of each spring. Use new dampeners whenever removed from spring. **Free Length**—2 9/16".

	Spring Pressure	Spring Length
Valve Closed	56-63 lbs.	1 29/32"
Valve Open	97-105 lbs.	1 19/32"

Valve Lifters:—Barrel type, cast-iron. Guide holes reamed in block. Lifters furnished .005" oversize (use pilot reamer J-706-P when reaming holes to maintain alignment). **Clearance**—Free fit. Lifter should just move freely with finger touch. **Valve Timing:**—See Camshaft Setting above. **Intake Valves**—Open 5° BTDC. Close 39° ALDC. **Exhaust Valves**—Open 45° BLDC. Close 5° ATDC. **Valve Timing Check**—With .015" tappet clearance #8 intake valve should open with #8 piston 5° or .0089" before top dead center with first straight line of flywheel mark '/IGN.ONE/' slightly past indicator in left front face of flywheel housing. Reset tappet clearance .011-.013" (warm).

LUBRICATION:—Pressure (pump on right of engine). *See Pontiac Shop Notes for Oil Pump servicing and new type Pontiac (built-in) Oil Cleaner servicing.* **Normal Oil Pressure:**—35-40 lbs. with warm oil. **Oil Pressure Regulator:**—On pump. Opens at 40 lbs. Non-adjustable type. **Crankcase Capacity:**—6 qts.

COOLING SYSTEM:—Capacity 19½ qts. *See Pontiac Shop Notes Radiator Core Removal & Water Distr. Tube data.* **Pressure Valve**—In filler cap. Opens at 3¾ lbs. **Water Pump:**—Packless, sealed ball-bearing type. *For complete data, refer to 1941 Mech. Equip. Index.* **Thermostat:**—Harrison. In cylinder head outlet. **Setting**—Starts to open 151° F. Fully open 173° F. **Temperature Gauge:**—AC Electric. No. 1511053 (Dash Unit), No. 1510772 (Engine Unit). *For complete data, refer to 1941 Mech. Equip. Index.*

CLUTCH:—Inland. 'Diaphragm' type, single plate, dry disc type with Long 9½CF-TS, No. CM-5253 driven member. *For data, refer to Mech. Equip. Index.* **Facings** Moulded, 2 used. Inside Diameter 6". Outside Diameter 9½". Thickness .125" (⅛"). **Pedal Adjustment:**—Free travel ⅞-1⅛" (adjusting nut on link at clutch fork). Pedal height to lower face of pedal should be 4¾" (41-27), 5 3/16" (others). Adjust stopscrew at lower end of pedal arm. **Removal:**—Remove transmission (see below), take off bottom housing cover and control shaft inner bracket. Disconnect pedal pull-back spring. Remove fork ball support, fork, and throwout bearing. Paint mark cover and flywheel (locating pin in flywheel discontinued) and reassemble to these marks to maintain balance. Remove cover bolts evenly until tension relieved. Move clutch away from flywheel at bottom to remove disc, lower assembly out of car.

TRANSMISSION:—Own Make. All helical gear, constant-mesh, synchro-mesh (second & high), sliding gear (low & reverse) with remote shift. *For complete data, refer to 1941 Mech. Equip. Index.* **Transmission Control:**—Pontiac 'Safety-Shift' type. NOTE—Single shifter rod (replacing 2 rods and idler) used on late 41-28, 41-29 and for replacement. *For complete data, refer to 1941 Mech. Equip. Index.* **Removal:**—Disconnect speedometer cable, gearshift selector and control rods from transmission. Disconnect rear universal (wire trunnions) and pull out propeller shaft. Remove upper transmission mounting screws, install guide pins (J-851), remove lower screws, pull transmission to rear and lower out of car.

UNIVERSAL JOINTS:—Mechanics 2C or 2CR (new type). Roller bearing types. *For complete data, refer to 1941 Mech. Equip. Index.* NOTE—1 piece driveshaft used. Slip joint formed at rear of transmission ahead of front universal.

REAR AXLE:—Own Make. Semi-floating, Hypoid gear type with Hotchkiss drive. *For complete data, refer to 1941 Mech. Equip. Index.* **Ratio**—4.3-1 (white) 41-28, 41-29. 4.1-1 (green) 41-27. 3.9-1 (red) Economy. 4.55-1 Heavy Duty (yellow). Color marked on end of right axle shaft. **Backlash**—.003-.012" (new), slightly over .012" (worn). **Removal:**—Disconnect rear universal and wire trunnions (do not disengage spline joint at transmission), remove axle shafts (see below), remove carrier flange capscrews, pull carrier assembly out. **Axle Shaft Removal:**—Remove wheel, brake drum, 4 backing plate bolt nuts, static collector, and loosen bearing retainer (do not move backing plate or brake line may be damaged). Pull shaft with puller J-942 (do not drag axle shaft on oil seal). **Wheel Bearing Adjustment**—None.

SHOCK ABSORBERS:—Delco. FRONT—Model 1947-C (right), D (left). REAR—1024-V (Domestic). Double acting, hydraulic (1024-V direct acting). *For complete data, refer to 1941 Mech. Equip. Index.*

STEERING:—Steering Gear Saginaw worm-and-roller. *For complete data, refer to 1941 Mech. Equip. Index.* **Front Suspension:**—Independent, linked parallelogram type with coil springs. *For complete data, refer to 1941 Mech. Equip. Index.* **Kingpin Inclination**—4⅜° to 4⅞°. **Caster**—Negative ¾°. Limits Neg. ½° to Neg. 1°. **Camber**—0° preferred. Limits Neg. ¼° to Pos. ¼°. **Toe In**—0-1/16". Adjust tie rod tubes equally. **Steering Geometry**—Inner wheel 23° ± ½°. Outer 20°.

BRAKES:—Service. Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes. *For complete data, refer to 1941 Mech. Equip. Index.* **Wheel Cylinder Bore**—Front wheel 1". Rear 15/16". **Drums**—Steel (nickel alloy iron liner). Diameter 11". **Lining**—Moulded. Width 1¾". Thickness 3/16". Length 9 11/32" (Primary shoe—D-R Multibestos), 11 31/32" (Secondary shoe—L-8 Multibestos). **Clearance**—.015" at both ends of secondary shoe with primary shoe forced out against drum. **Hand Brake:**—See Service Brakes above.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

HOOD LOCK (ALL MODELS):—Hood is Alligator type with hood lock release knob in driver's compartment below edge of instrument panel to left of steering column. To raise hood, pull out on release knob (hood will raise slightly), pull forward on safety catch under front edge of hood (ahead of lock stud), raise hood.

Hood Lock Adjustment—Lock stud should be positioned so that hood locks securely with firm pressure on top of hood (if stud adjusted too high, hood will not lock securely; if stud adjusted too low, hood will rattle). To adjust lock, loosen locknut on upper end of lock stud, engage screwdriver in slot at lower end of stud, turn stud counter-clockwise to lower stud, clockwise to raise stud, tighten locknut after completing adjustment. Lubricate latch on underside of grille top baffle and control wire in cable conduit for smooth operation.

HOOD SIDE PANEL REMOVAL:—Separate removable hood side panels used. To remove, take out attaching bolts on each panel.

ORIGINAL BORE & PISTON SIZES:—Bore Size—Marked by figure stamped on top face of cylinder block next to each cylinder bore as follows:

Champion		Commander		President	
Mark	Size	Mark	Size	Mark	Size
0	3.000"	25	3.3125"	05	3.0605"
05	3.0005"	3	3.313"	1	3.061"
1	3.001"	35	3.3135"	15	3.0615"
15	3.0015"	4	3.314"	2	3.0620"
2	3.002"	45	3.3145"	25	3.0625"
25	3.0025"	5	3.315"	3	3.063"

Original Pistons—Stamped with size of cylinder bore in which pistons are installed.

Replacement Pistons—Stamped figure on top indicates actual size of piston.

CYLINDER HEAD INSTALLATION:—Coat both bottom of head gasket and lower face of cylinder head with Perfect Seal Gasket Cement (use sparingly), coat head capscrews with white lead. Tighten head screws to tension of 600-650 in. lbs. (Champion), 1000 in. lbs. (Commander & President) and recheck before starting engine.

CONNECTING ROD 'PALNUT' INSTALLATION:—Used on all models. Consists of a special patented locknut installed on top of regular nut instead of cotter-pin. To install Palnut, tighten regular nut to tension of 300-325 in. lbs. (Champion), 650 in. lbs. (Commander & President), install Palnut with open face out (away from regular nut), tighten Palnut until it just contacts regular nut, then tighten Palnut ⅓ turn additional to lock it in place.

PISTON PIN REMOVAL & INSTALLATION:—Champion—Tapered pin and nut secures pin in rod. To remove pin, place rod and piston on assembling fixture No. J1293, take nut off and install on opposite end of pin and turn nut down pulling pin out. To install, place pin on fixture, slip piston and rod on pin, tighten pin nut (rock rod to insure lock pin seats properly). One nut only used on tapered lock pin.

SELF-LOCKING TAPPETS:—Champion—Tappet screws slotted on upper end and require no locknuts. When tappet screws replaced, car manufacturer recommends that screws must check as follows: Pull required to move tappet screw must be 25 in. lbs. minimum (4 lbs. pull on 6" wrench).

VIBRATION DAMPENER:—President—Consists of a spring-loaded flywheel mounted on four tapered rubber cushions between a friction facing on the fan pulley and a damper plate on the front end of the crankshaft. The flywheel oscillation is controlled by the friction of the friction facing and the compression of the rubber cushions. Flywheel radial movement is controlled by a fibre ring on the fan pulley hub. Spring tension is adjusted by shims under spring in flywheel, compression of rubber cushions adjusted by shims on bolt sleeve between cushion and damper plate.

Removal & Installation:—Dampener can be removed as an assembly (without disturbing adjustment) by removing two of the four retaining screws in the damper plate (do not disturb other two screws). Use Puller HM-925 to remove dampener assembly by installing two puller screws in holes from which dampener retaining screws removed.

NOTE—When installing crankshaft nut, make certain that copper-asbestos gasket in place under nut (necessary to prevent oil leaks at this point).

Servicing:—If dampener disassembled for replacement of rubber cones or springs, these parts must be adjusted when re-installed as follows:

Rubber Cones—Assemble friction facing, damper flywheel, bolt sleeves, and rubber cones on top of fan pulley. Install one heavy washer on top of each cone. Press cones and spacer sleeves firmly down in position, measure amount spacer projects above face of heavy washer on cone by using feeler gauge (build up feeler gauge thickness until top surface of feeler even with top edge of spacer sleeve). Measure total thickness of feeler gauge and heavy washer with micrometer, select two heavy washers and shims (as required) equal to the micrometer reading **plus .015"** (to insure correct cone compression of .015"), install this shim and washer pack on top of the rubber cone when installing the damper plate and retaining screws, tighten screws securely (sleeves limit cone compression to correct figure).

Damper Springs—Shims are installed in flywheel under each tension spring so that spring pressure is 50 lbs. each or 200 lbs. total. If new springs installed, use same shim pack as removed from under old spring.

VIBRATION DAMPENER:—Commander—Consists of a flywheel mounted on two rubber discs (discs have insulating buttons at pilot rivet holes) mounted on the crankshaft pulley hub at the forward end of the crankshaft and retained by a large nut on the end of the crankshaft. Compression of rubber discs is limited by length of crankshaft pulley hub (when retaining nut drawn up securely) and no adjustment required. If dampener does not operate correctly, replace rubber discs.

CAMSHAFT REMOVAL:—Champion—To remove camshaft, use Puller HM-925 to remove crankshaft fan pulley, take out screws and remove timing gear cover. Remove oil pump and drive shaft, take off valve tappet cover plates, remove cylinder head. Install special valve lifter supports (see Note below) on each valve lifter (lifters are mushroom type and must be blocked up so as to clear cam lobes). Remove two capscrews retaining camshaft thrust plate (insert socket wrench between camshaft gear spokes), pull camshaft gear and camshaft out as an assembly. When installing camshaft, do not tighten timing gear cover screws until after crankshaft pulley has been installed so as to secure correct alignment of pulley hub and oil seal washer in gear cover.

NOTE—Valve lifter supports should be made of hardened strip steel in inverted 'U' shape .750" high and 21/32" wide (inside). A ⅜" slot, 9/16" deep, with rounded end and 1/16" radius corners, should be cut in top of support and front corners should be beveled ⅛" for distance ⅜" back from front edge. This will allow supports to be tipped down to engage lifters and will raise lifters sufficiently to clear cams when supports pushed in place.

Commander—To remove camshaft, use Puller HM-925 to remove vibration dampener assembly, take out screws and remove timing gear cover. Remove cylinder head and valve tappet cover plates, remove oil pump assembly. Remove valves, springs, and valve lifters (lifters are barrel type and can be removed from above after adjusting screw removed). Insert wrench through timing gear spokes and remove two camshaft thrust plate retaining screws. Pull camshaft gear and camshaft out as an assembly. When installing camshaft, do not tighten timing gear cover screws until after vibration dampener has been installed to secure correct alignment of crankshaft pulley hub and oil seal washer in timing gear cover.

President—Camshaft removal same as Commander model (above) except that valve tappet and guide assemblies should be taken out by removing screws in each assembly. When re-installing these assemblies, make certain that gaskets are in place and that oil holes in gaskets line up with holes in block.

TIMING GEARS:—Camshaft Gears (All Models)—Holes provided in gears (on Champion and Commander), gear hub recess threaded (President) for gear puller to remove gears. Use tool HM-925 (Champ.&Comm.), HM-865 (President). See Replacement Camshaft Gear Sizes (below) for size selection when replacing gears. Use gear pusher tool HM-861X (all models) to install gears. CAUTION—Do not drive gears on with a hammer which will loosen gear at hub.

Replacement Camshaft Gear Sizes:—Furnished in three sizes: 'S'—Standard, 'H'—High Limit, 'L'—Low Limit. When replacing gear on engine with considerable service, install next largest camshaft gear size. For reconditioned engine with new camshaft and main bearings use same size gear. Crankshaft gear furnished in standard size only.

Crankshaft Gear (All Models):—Tapped holes provided in all gears for puller. Use Puller HM-925 to remove gear, Pusher HM-861X to install gear.

VALVE SPRING INSTALLATION:—Valve Lifter Tension Springs (All Models)—Consists of a 'U' shaped flat spring installed so as to engage lower end of valve stem and upper end of lifter (spring tension keeps lifter on cam lobe). Make certain that these tension springs in place when valves and springs installed.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Spring Dampers (Commander & President)—Consist of open-sided cages installed on upper (closed coil) end of each valve spring. Make certain that dampers in place when springs installed. Dampers not used on Champion Valve Springs.

OIL PAN INSTALLATION:—Champion—Separate oil filler block and pan gasket used at front end of engine. When installing oil pan, install filler block and gasket first, align filler block screw holes with drift and install and tighten filler block screws securely. See that filler block gasket is in good condition and properly aligned (rubber band may be used to retain gasket until pan installed), install side and rear gaskets, use pilot screws to guide pan into place.

Commander—Oil pan removal and installation will be facilitated by turning crankshaft so that #2 piston is on top dead center.

OIL PUMP INSTALLATION:—Commander. To insure correct rotor position of distributor when pump installed, install pump as follows: Remove distributor, crank engine over (with piston #1 on compression) until vibration damper mark 'UDC/1-6' lines up with pointer on gear case, sight down distributor shaft hole and mesh oil pump drive gear so that drive tongue on shaft is 30° from the horizontal (upper end pointing toward rear of engine) with offset toward the top. Distributor shaft slot should engage drive tongue with rotor turned to #1 segment in distributor cap.

Champion:—Install oil pump as follows: Turn engine over until #1 piston at TDC. entering power stroke (flywheel mark U.D.C.1-6 in line with pointer on left rear engine plate). Engage pump shaft with camshaft gear with key-way pointing down (keyway will rotate to rear when gears meshed), assemble pump to engine. Check distributor drive tongue position by sighting down distributor shaft hole (distributor out). With #1 cylinder in firing position, tongue should be parallel with camshaft and offset (narrow half of shaft) toward camshaft. Distributor shaft slot should engage drive tongue with rotor turned to #1 segment in distributor cap.

President:—Install oil pump as follows: Turn engine over until piston #1 is on TDC entering power stroke with vibration damper mark 'UDC/1-8' lined up with pointer on gear case, turn pump shaft so that distributor drive tongue is approximately 45° from the vertical (upper end pointing toward rear of engine) with offset toward the top (right side of car when installed). Install pump which will rotate gear so that tongue should be approximately parallel with camshaft and offset away from shaft. Install distributor drive shaft, meshing slot at lower end with oil pump shaft tongue. Slot at upper end of shaft should be at right angles to camshaft and offset toward rear of engine. Distributor shaft tongue should engage with this slot with rotor turned to #1 segment in distributor cap.

CLUTCH RELEASE SHAFT LUBRICATION:—On all Studebaker models (see Champion Note below), bushing at each end of clutch release cross-shaft should be oiled with lubricating oil at regular chassis lubricating periods. CAUTION—If bushings not oiled. clutch may stick or slip due to seizing of shaft.

Clutch Release Shaft—Lubricate shaft at each side of clutch housing with SAE #30 engine oil every 1000 miles.

Clutch Cross Shaft—Remove cover on outside of frame siderail at left end of clutch cross-shaft and lubricate shaft at this point with SAE #30 engine oil every 5000 miles. CAUTION—When installing cover, make certain that felt, felt retainer, and spring are correctly installed within cover.

OVERDRIVE TRANSMISSION REAR SUPPORT INSTALLATION:—President Models—The rear support (must be removed to remove transmission) should be installed with original shims in same location in order to maintain alignment. These shims located between support and frame at each end. If shims lost or readjustment necessary, install support as follows: Hold support in place under transmission case, install sufficient shims at each end to take up all except 1/16" clearance between support and frame, install frame bolts, tighten bolts securely with shims in place. This clearance will provide correct compression of the support rubber cushions.

HILL HOLDER ADJUSTMENT:—On cars with Hill-Holder (optional equipment), check action whenever clutch adjusted to make certain that brakes release just before clutch engages.

Adjustment—Loosen locknut on end of Hill-holder control rod, shorten rod for earlier brake release, lengthen rod for later release, tighten locknut.

1940 & PREVIOUS MODELS

OIL LEAKS AT FAN DRIVE PULLEY (CHAMPION):—To correct oil leakage at this point on 1939 and 1940 cars, install special copper asbestos gasket No. 199108 on front face of fan drive pulley, install new heavier plain washer No. 189959 on gasket, and use new star type lockwasher on retaining screw when screw is replaced. NOTE—These parts are installed at factory on later 1940 cars. Star type lockwasher replaces helical type lockwasher used on earlier cars. New plain washer is 7/32" thick.

FRONT FENDER APRONS & BAFFLES:—To Correct Complaints of Ignition cutting out due to water splashing from road—Baffles should be installed on Champion cars and aprons should be checked on other models as follows:

Champion Models (1939-40):—Install baffles at front face of frame body brackets under each front fender to seal opening at rear edge of fender aprons. On late 1940 cars, holes are drilled in body bracket for baffle installation. On 1939 and early 1940 cars, drill hole 1" from top face of bracket and 1 7/16" from frame using 7/32" drill. Use special self-tapping screws to attach baffles.

Commander & President (1939-40):—Check shield at rear end of front fender aprons and bend apron so that anti-squeak strip riveted on lower edge of shield contacts forward face of front frame body bracket tightly. This will prevent water being deflected from bracket onto engine.

IMPORTANT SERVICE CAUTION—On cars before Serial No. 4157417 (Comm. 10A), 7134832 (Pres. 6C), check apron on both sides of car for interference with brake tubes located below lower edge of apron and bend apron in so that clearance is at least ¼".

CLUTCH RELEASE SHAFT LUBRICATION:—Champion 1939-40 Models—To prevent clutch slipping or sticking due to seizing of release shaft, shaft should be oiled at regular intervals as directed for 1941 model (above) and new type bushings can be installed as directed below. To correct squeaks or other noise at frame end of clutch release cross-shaft, felt oiler and cover should be installed on frame at outer end of shaft as directed below.

Champion Release Shaft Bushings (1939-40)—New type porous, oil-impregnated bushings available for service (Part No. 199918—bushing, 196080—bushing and retainer assembly) to correct sticking of shaft. The new bushings should be oiled regularly in same manner as other types as directed above.

Clutch Release Cross-shaft Oiler:—Consists of felt oiler, spring and cover similar to type used on all 1941 models. To install this assembly on 1939-40 cars, clean outer face of left frame siderail around end of clutch release cross-shaft and shaft, install felt on end of shaft, place cover over felt with attaching bolt holes along line of frame, mark bolt holes for drilling, remove cover and felt, drill holes for attaching bolts with 7/32" drill. Saturate felt (Part No. 199621) with #30 engine oil and install felt on end of shaft, install felt retainer washer, retainer spring (Part No. 631893), and cover (Part No. 199619) in order and tighten cover bolts securely. Cover should be removed and felt lubricated with SAE #30 engine oil every 5000 miles.

ENGINE PAN INSTALLATION:—Champion 1939-40—To prevent mud and water splashing up on engine from road, special service pans, Front Engine Pan Part No. 199059, and Engine Side Pan Part No. 197183, may be installed as follows:

Engine Front Pan—Place pan in position between two front cross-members with notched edge clearing fuel line, mark mounting hole locations. Drill five mounting holes with 13/64" drill, bolt pan in position.

Engine Side Pan—Place pan in position on left side of engine so that it clears steering gear and clutch housing (pan attaches to upper edge of frame siderail and re-inforcing brace to lower edge), mark mounting hole locations. Drill three 13/64" mounting holes in top edge of frame for pan bolts, one 13/64" hole in lower edge of frame for re-inforcing brace, bolt pan and brace in position.

HOOD LOCK:—*See Studebaker Shop Notes for data.*

SERIAL NUMBER:—On left front door hinge post. First No.: 90101 (South Bend), 811201 (Los Angeles).

ENGINE NUMBER:—First number 101201. Stamped on pad on upper left front corner of engine block.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3". **Stroke**—4".
Displacement—169.6 cu. ins. **Rated HP**—21.6.
Developed Horsepower—80 HP at 4000 RPM.
Compression Ratio—6.5-1 Std. cast-iron head.
Compression Pressure—105 lbs. at 150 RPM.
See Studebaker Shop Notes for Cyl. Head Installation.
Vacuum Reading—Steady 17-18" idling at 8 MPH.

PISTONS:—Aluminum alloy, T-slot, cam ground, tin plated. **Length** 2 29/32". **Weight** 8.96 ozs. (stripped). **Removal**—Pistons and rods removed from above. **Clearance**—Top .014-.019" Skirt .0015" selective.
Original Bore & Piston Sizes, Replacement Pistons:—*See Studebaker Shop Notes for sizes and markings.*
Fitting New Pistons:—Insert .002" x 1" feeler between piston and wall on camshaft side (pin parallel to crankshaft, T-slot away from camshaft). Pull to withdraw feeler 16-22 lbs. NOTE—Cylinders out-of-round or taper over .002" should be reconditioned.
Installing Pistons:—T-slot away from camshaft.

PISTON RINGS:—3 coated rings, all above pin. #1 Comp. '200' (step up). #2 Comp. '70' (step down). #3 Oil '85' (slotted). Heat dam above #1 groove.

Ring	Width	End Gap	Side Clearance
Comp. (Top)	3/32"	.007-.017"	.0015-.002"
Comp. (#2)	1/8"	.007-.017"	.0015-.002"
Oil Control	5/32"	.007-.017"	.0015-.002"

Replacement Rings:—Std. & .010", .020", .030" oversize.

PISTON PIN:—**Diameter** .7491-.7495". **Length**—2⅝". Pin locked in rod by tapered pin and locknut.
See Studebaker Shop Notes for Pin Servicing data.
Pin Fit in Piston—.0001-.0003" clearance or light finger-push fit at room temperature (70°).
Replacement Pins:—Std. & .0025", .005" oversize. Use Hone No. PH-1 to obtain proper piston fit.
NOTE—Replacement pistons fitted with pins.

CONNECTING ROD:—**Length** 6⅜". **Weight** 20.96 ozs.
Crankpin Journal Diameter—1.81175-1.81275".
Lower Bearing—Spun babbitt (cap bearings chamfered on upper edge). New rods furnished on exchange basis standard and .010", .020" undersize.
Clearance—.0005-.002". **Sideplay**—.005-.009".
NOTE—Use reamer HM-591-F to secure correct bearing clearance. Crankpin out-of-round, tapered or scored .0015" max. (use Tool No. 1C for reconditioning crankpins).
Bearing Adjustment:—None. Replace rods.
See Studebaker Shop Notes for 'Palnut' installation.
Installing Rods:—Narrow portion of bearing to front (#1, 3, 5), to rear (#2, 4, 6). Side marked with cyl. number and oil spray hole toward camshaft.

CRANKSHAFT:—4 bearing, integral counterweights.
Journal Diameter—2.437-2.4375".
Bearings—Removable steel-backed, babbitt-lined.
Clearance—.0005-.0025".
Adjustment:—None (no shims). Replace bearings (std. size, .010", .020", .030" undersize).
NOTE—Front oil pan seal block may be removed for access to front main bearing cap by removing 4 lower timing gear cover screws (on front face).
End Thrust:—Thrust plate assembled between front bearing and crankshaft gear. Controlled by shims (furnished .003", .005", .007" thick) between plate and journal face. **Endplay**—.003-.006".
NOTE—Install new seals (specially treated wood) whenever rear main bearing cap replaced

CAMSHAFT:—Four bearing with helical gear drive.
See Studebaker Shop Notes for Camshaft Removal.
Journal Diameters—#1, 1.7475-1.7480"; #2, 1.71625-1.71700"; #3, 1.68575-1.68650"; #4, 1.62325-1.62400".
Bearings—Split steel-backed, babbitted bushings.
NOTE—Align bushing with oil hole in block.
Clearance—.00075-.00225" (#1), .001-.00275" (others).
End Thrust:—Taken by thrust plate assembled on front face of engine behind camshaft gear. Spacer assembled back of gear hub. **Endplay**—.004-.008"
Timing Gears:—Crankshaft (cast-iron), Camshaft (Celeron with steel hub). **Backlash** .001-.003".
See Studebaker Shop Notes for Gear Removal and Replacement Gear size selection.
Camshaft Setting:—Mesh marked camshaft gear tooth between two marked teeth on camshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 11/32"	.310-.311"	4 11/32"
Exhaust	1 9/32"	.310-.311"	4 11/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	5/16"	.001-.0035"

Tappet Clearance:—.016" (cold) all valves. Self-locking tappet screw tension should be 25 in. lbs. Remove hood side panel for access to valves.
Valve Guides:—Pressed in block from above 1 3/16" below top of block. Finish ream to .312-.3135".
Valve Springs:—Install with closed coil up. Replace if springs over 10% weak (test with Tool U-15).

Free length 2 3/32".	Spring Pressure	Length
Valve Closed	49-53 lbs.	1 21/32"
Valve Open	90-94 lbs.	1 11/32"

Valve Lifters:—Mushroom type (remove from below). **Diameter**—.62375-.62425". **Clearance** .0005-.00175". Lifters furnished .0005", .001" oversize.
Valve Timing:—See Camshaft Setting above.
Intake Valves—Open 15° BTDC. Close 49° ALDC.
Exhaust Valves—Open 54° BLDC. Close 10° ATDC.
Valve Timing Check—With .020" tappet clearance #1 intake valve should open with #1 piston 15° or .0893" BTDC with flywheel mark 'IN.OP.1-6/' aligned with pointer on left rear engine plate. Reset tappet clearance at .016" (cold).

LUBRICATION:—Pressure (pump on right of engine).
See Studebaker Shop Notes for Oil Pan and Oil Pump installation instructions.
Normal Oil Pressure:—40 lbs. at 25-30 MPH.
Oil Pressure Relief Valve:—On lower right front corner of engine block. Opens at 30-40 lbs. Not adj.
Crankcase Capacity:—5 quarts.

COOLING SYSTEM:—**Capacity**—10 quarts.
Water Pump:—Packless, sealed ball-bearing type.
For complete data, refer to 1941 Mech. Equip. Index.
Removal—Drain water, remove fan belt, fan blades and pulley, pump hose, 3 pump mounting screws.
Thermostat:—Bishop & Babcock. In cyl. head outlet.
Setting—Starts to open 151° F. to 155° F.
Drain Valves:—At radiator lower tank and plug on left side of cylinder block at rear. If heater used, disconnect hose at cylinder head and hold hose below level of heater.

CLUTCH:—**Borg & Beck Model 8A7 with 'Borglite' driven member.** Clutch assembly No. 925 stamped on cover. Single plate, dry disc type.
For complete data, refer to 1941 Mech. Equip. Index.
Facings—Molded-metallic (spiral-grooved), 2 used. Inside Diam. 5⅜". Outside Diam. 8". Thickness ⅛".
Adjustment:—Free travel 1" (min.). Turn adjusting sleeve on pedal connector link.
Hill-Holder (NoRol) Note—Check whenever clutch pedal adjusted. Set so that Hill-Holder releases just as clutch engages (change rod length).
Removal:—Remove transmission (see below), take off clutch housing, take out 6 mounting screws in clutch cover flange, lift off cover assembly.
See Studebaker Shop Notes for Clutch Release Shaft Lubrication instructions.

TRANSMISSION:—**Warner.** Model AS1-T84G (Std.), AS2-T84G Type R7C (optl. overdrive with electrical 'kick-down' control). All helical gear type, synchromesh (second & high), sliding gear (low & reverse).
For complete data, refer to 1941 Mech. Equip. Index.
Transmission Control:—Mechanical steering col. shift.
For complete data, refer to 1941 Mech. Equip. Index.
Removal:—Disconnect the rear universal and withdraw propeller shaft from transmission. Disconnect shift levers and speedometer cable at transmission. Place jack under engine rear plate and free rear engine support. Remove transmission-to-clutch housing capscrews, pull transmission out.
Overdrive Note—On cars with overdrive, disconnect overdrive control cable and solenoid wires.

UNIVERSAL JOINTS:—**Spicer Model 1268-102.** Needle bearing type. Two used.
For complete data, refer to 1941 Mech. Equip. Index.
NOTE—1 piece driveshaft used. Slip joint formed at rear of transmission ahead of front universal.

REAR AXLE:—**Spicer Model 23.** Semi-floating, Hypoid gear type with Hotchkiss drive.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—4.56-1 standard. 4.10-1 optional.
Backlash—.005-.007". Shim adjustment.
Removal:—Hoist rear of car, disconnect propeller shaft at rear universal, hydraulic brake lines, brake cables, and shock absorbers. Remove spring U-bolts, disconnect rear spring shackles and withdraw axle.
NOTE—Use Puller HM-931 to remove axle shaft, Handle J-270-1 and disc J-270-13 to install inner shaft oil seal.
Wheel Bearing Adjustment:—Shims between backing plate and axle housing. With wheel and hub removed (use Hub Puller J-446) check endplay with dial indicator. To adjust, remove backing plate, add or remove shims (.003", .005", .010", .030" thick).
Endplay—.001-.005".

SHOCK ABSORBERS:—**Houdaille. Model BBFS2 (front), BBDS (rear).** Double acting, hydraulic.
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—**Steering Gear**—Ross Model T-12. Cam-and-Twin lever type.
For complete data, refer to 1941 Mech. Equip. Index.
Front Suspension:—Planar type independent suspension with transverse spring. Specifications below apply with car weight on wheels but without load.
For complete data, refer to 1941 Mech. Equip. Index.
Kingpin Inclination—5½°.
Caster—1° to 2°.
Camber—¼° to ¾°. Shim adjustment.
Toe In—1/16-⅛". Adjust right reach rod only for toe-in. Left rod should be adjusted first for left wheel straight-ahead position (steering wheel centered).
Steering Geometry (toe-out on turns)—Inner wheel turned 22½-23°. Outer wheel turned 20°.

BRAKES:—**Service.** Lockheed hydraulic, single anchor type. Hand lever applies rear service brakes.
For complete data, refer to 1941 Mech. Equip. Index.
Drum—Budd composite. Diameter 9".
Lining—Moulded. Length per shoe 10 3/16". (front), 7 13/16" (rear). Width 1¾". Thickness 3/16".
Clearance—.010" toe (top), .005" heel, for each shoe.
Braking Power—43% rear wheels, 57% front.
Hand Brake:—See Service Brakes (above).
Hill-Holder (NoRol):—Optional Equipment.
For complete data, refer to 1941 Mech. Equip. Index.

HOOD LOCK:—*See Studebaker Shop Notes for data.*

SERIAL NUMBER:—On left front door hinge post. 1st No. 4178801 (South Bend), 4811901 (Los Angeles).

ENGINE NUMBER:—First number H-122201. Stamped on upper left side of cylinder block at center.

ENGINE SPECIFICATIONS:—6 cylinder, 'L' head type. **Bore**—3 5/16". **Stroke**—4⅜". **Displacement**—226.2 cu. ins. **Rated HP**—26.35. **Developed Horsepower**—94 at 3600 RPM (Std. hd.). **Compression Ratio**—6.5-1 Standard cast-iron head. 7.0-1 cast-iron head optional. **Compression Pressure**—105 lbs. at 150 RPM (Std.hd.). *See Studebaker Shop Notes for Cyl. Head Installation.* **Vacuum Reading**—Steady 18-20" idling at 8 MPH.

PISTONS:—Aluminum alloy, T-slot, cam ground, tin plated. **Length** 3¾". **Weight** 14.4 ozs. (stripped). **Removal**—Pistons and rods removed from above. **Clearance**—Top .0125-.0175". Skirt .0015".

Original Bore & Piston Sizes, Replacement Pistons:—*See Studebaker Shop Notes for sizes and markings.*

Fitting New Pistons:—Insert .002" x 1" feeler between piston and wall on camshaft side (pin parallel to crankshaft, T-slot away from camshaft). Pull to withdraw feeler 14-19 lbs. NOTE—Cylinders out-of-round or taper over .002" should be reconditioned.

Installing Pistons:—T-slot away from camshaft.

PISTON RINGS:—3 coated rings, all above pin. #1 and #2 Compression (beveled face up), #3 Sealed Power oil ring. Heat dam groove above top ring.

Ring	Width	End Gap	Side Clearance
Compression	.0925-.0935"	.009-.014"	.0015-.002"
Oil Control	.186-.1865"	.009-.014"	.0015-.002"

Replacement Rings:—Std. & .010", .020", .030" oversize.

PISTON PIN:—**Diameter**—⅞". **Length**—2⅞". Pin locked in connecting rod by lock screw. **Pin Fit in Piston**—.0001-.0003" clearance or light finger-push fit at room temperature (70°).

Replacement Pins:—Std. & .0025", .005" oversize. Use Hone No. PH-1 to obtain proper piston fit. NOTE—Replacement pistons fitted with pins.

CONNECTING ROD:—**Length**—8⅞". **Weight**—33.2 ozs. **Crankpin Journal Diameter**—2.18675-2.18775". **Lower Bearing**—Spun babbitt (cap bearings chamfered on upper edge). New rods furnished on exchange basis standard and .010", .020" undersize. **Clearance**—.0005-.002". **Sideplay**—.005-.009". NOTE—Use reamer HM-591-D to secure correct bearing clearance. Crankpin out-of-round, tapered or scored .0015" max. (use Tool No. 1C for reconditioning crankpins).

Bearing Adjustment:—None. Replace rods. *See Studebaker Shop Notes for 'Palnut' installation.*

Installing Rods:—Narrow portion of bearing to front (#1, 3, 5), to rear (#2, 4, 6). Side marked with cyl. number and oil spray hole toward camshaft.

CRANKSHAFT:—4 bearing, 5 integral counterweights. Vibration damper mounted on forward end of shaft. *See Studebaker Shop Notes for Vibration Damper data.* **Journal Diameter**—2.4995-2.5000". **Bearings**—Removable steel-backed, babbitt-lined. **Clearance**—.0005-.0025".

Adjustment:—None (no shims). Replace bearings (std. size, .010", .020", .030" undersize).

End Thrust:—Thrust plate assembled between front bearing and crankshaft gear. Controlled by shims (furnished .003", .005", .007" thick) between plate and journal face. **Endplay**—.003-.006". NOTE—Install new seals (specially treated wood) whenever rear main bearing cap replaced

CAMSHAFT:—Four bearing with helical gear drive. *See Studebaker Shop Notes for Camshaft Removal.* **Journal Diameters**—#1, 1.9975-1.998"; #2, 1.96625-1.967"; #3, 1.93575-1.9365"; #4, 1.12325-1.124". **Bearings**—Split steel-backed, babbitted bushings. NOTE—Align bushing with oil hole in block. **Clearance**—.00075-.00225" (#1), .001-.00275" (others).

End Thrust:—Taken by thrust plate assembled on front face of engine behind camshaft gear. Spacer assembled back of gear hub. **Endplay**—.004-.008"

Timing Gears:—Crankshaft (cast-iron), Camshaft (Celeron with steel hub). **Backlash** .001-.003". *See Studebaker Shop Notes for Gear Removal and Replacement Gear size selection.*

Camshaft Setting:—Mesh marked camshaft gear tooth between two marked teeth on camshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 15/32"	11/32"	5 7/32"
Exhaust	1 9/32"	11/32"	5 7/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	11/32"	.0015-.0035"

Tappet Clearance:—.016" (cold) all valves. Remove hood side panel for access to valves.

Valve Guides:—Pressed in block from above (1 5/32" below upper edge of valve seat) with stepped end down. Ream to inside diameter of .3425-.3445".

Valve Springs:—Install with closed-coil up and dampener on top of spring. Replace springs if 10% weak (test with Tool U-15). **Free Length**—2½". *See Studebaker Shop Notes for Valve Spring installation.*

	Spring Pressure	Spring Length
Valve Closed	54-60 lbs.	2 3/32"
Valve Open	125-135 lbs.	1¾"

Valve Lifters:—Barrel type (remove from above with valve, valve spring and adjusting screw removed). Furnished std. size and .0005", .001" oversize. **Diameter** .9985-.999". **Clearance** .0005-.00175".

Valve Timing:—See Camshaft Setting above. **Intake Valves**—Open 15° BTDC. Close 49° ALDC. **Exhaust Valves**—Open 54° BLDC. Close 10° ATDC. **Valve Timing Check**—With .020" tappet clearance #1 intake valve should open with #1 piston 15° or .0942" BTDC with vibration damper mark 'IN.OP1-6/' aligned with pointer on timing gear cover. Reset tappet clearance .016" (cold).

LUBRICATION:—Pressure (pump on right of engine). *See Studebaker Shop Notes for Oil Pump installation.* **Oil Pan Note**—Place #2 piston at approx. top dead center to facilitate Oil Pan Removal & Installation.

Normal Oil Pressure:—40 lbs. at 25-30 MPH.

Oil Pressure Relief Valve:—On lower right front corner of engine. Opens at 30-40 lbs. Not adjustable.

Crankcase Capacity:—6 quarts.

COOLING SYSTEM:—**Capacity**—13 quarts.

Water Pump:—Centrifugal with adjustable packing, lubricant fitting and grease cup for bushings. *For complete data, refer to 1941 Mech. Equip. Index.* **Removal**—Drain water, remove fan belt, fan blades and pulley, pump hose. Take out mounting bolts.

Thermostat:—Bishop & Babcock or Fulton., In cylinder head outlet. Install with bellows down. **Setting**—Starts to open 151° F. to 155° F.

Drain Valves:—At radiator lower tank and plug on left side of cylinder block at rear. If heater used, disconnect hose at cylinder head and hold hose below level of heater.

CLUTCH:—**Borg & Beck Model 9A7 with 'Borglite' driven member.** Clutch Assembly No. 943 stamped on cover. Single plate, dry disc type. *For complete data, refer to 1941 Mech. Equip. Index.* **Facings**—Molded-metallic (spiral-grooved), 2 used. Inside Diam. 6". Outside Diam. 9¼". Thickness ⅛".

Adjustment:—Free travel 1" (min.). Turn adjusting sleeve on pedal connector link. **Hill-Holder (NoRol) Note**—Check whenever clutch pedal adjusted. Set so that Hill-Holder releases just as clutch engages (change rod length).

Removal:—Remove transmission (see below), take off clutch housing, take out 6 mounting screws in clutch cover flange, lift off cover assembly. *See Studebaker Shop Notes for Clutch Release Shaft Lubrication instructions.*

TRANSMISSION:—**Warner.** Model AS1-T86D (Std), AS2-T86D Type R7C (optl. overdrive with electrical 'kick-down' control). All helical gear type, synchromesh (second & high), sliding gear (low & reverse). *For complete data, refer to 1941 Mech. Equip. Index.*

Transmission Control:—Mechanical steering col. shift. *For complete data, refer to 1941 Mech. Equip. Index.*

Removal:—Disconnect rear universal and withdraw propeller shaft from transmission. Disconnect shift levers and speedometer cable at transmission. Place jack under engine rear plate and free rear engine support. Remove transmission-to-clutch housing capscrews, pull transmission out to rear. **Overdrive Note**—On cars with overdrive, disconnect overdrive control cable and solenoid wires.

UNIVERSAL JOINTS:—**Spicer Model 1268-102.** Needle bearing type. Two used. *For complete data, refer to 1941 Mech. Equip. Index.* NOTE—1 piece driveshaft used. Slip joint formed at rear of transmission ahead of front universal.

REAR AXLE:—**Spicer Model 41-2.** Semi-floating, Hypoid gear type with Hotchkiss drive. *For complete data, refer to 1941 Mech. Equip. Index.* **Ratio**—4.55-1 standard. 4.82-1 optional. **Backlash**—.005-.007". Shim adjustment.

Removal:—Hoist rear of car, disconnect propeller shaft at rear universal, hydraulic brake lines, brake cables, and shock absorbers. Remove spring U-bolts, disconnect rear spring shackles and withdraw axle. NOTE—Use Puller HM-931 to remove axle shaft, Handle J-270-1 and disc J-270-6 to install inner shaft oil seal.

Wheel Bearing Adjustment:—Shims between backing plate and axle housing. With wheel and hub removed (use Hub Puller ST-500) check endplay with dial indicator. To adjust, remove backing plate, add or remove shims (.003", .005", .010", .030" thick). **Endplay**—.001-.005".

SHOCK ABSORBERS:—**Houdaille, Model BBFS2 (front) ACHS2 (rear).** Double acting, hydraulic, adjustable type with thermostatic control (rear only). *For complete data, refer to 1941 Mech. Equip. Index.*

STEERING:—**Steering Gear**—Ross Model T-14. Cam-and-Twin lever type. *For complete data, refer to 1941 Mech. Equip. Index.*

Front Suspension:—Planar type independent suspension with transverse spring. Specifications below apply with car weight on wheels but without load. *For complete data, refer to 1941 Mech. Equip. Index.* **Kingpin Inclination—5½°.** **Caster**—Negative ¼° to Positive ¾°. **Camber**—¼° to ¾°. Shim adjustment. **Toe In**—1/16-⅛". Adjust right reach rod only for toe-in. Left rod should be adjusted first for left wheel straight-ahead position (steering wheel centered). **Steering Geometry (toe-out on turns)**—Inner wheel turned 22-22½°. Outer wheel 20°.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand lever applies rear service brakes. *For complete data, refer to 1941 Mech. Equip. Index.* **Wheel Cylinders**—Stepped or two-stage bore type. **Drum**—Budd composite. Diameter 11". **Lining**—Moulded. Width 2". Thickness 3/16". Length per shoe (each wheel): 11⅛" front, 8 9/16" rear. **Clearance**—.010" toe (top), .005" heel, for each shoe. **Braking Power**—45% rear wheels, 55% front.

Hill-Holder (NoRol):—Standard equipment. *For complete data, refer to 1941 Mech. Equip. Index.*

HOOD LOCK:—*See Studebaker Shop Notes for data.*

SERIAL NUMBER:—On left front door hinge post. 1st no.: 7139101 (South Bend), 7803901 (Los Angeles).

ENGINE NUMBER:—First number B-45001. Stamped on upper left side of cylinder block at center.

ENGINE SPECIFICATIONS:—8 cylinder, 'L' head type. **Bore**—3 1/16". **Stroke**—4¼". **Displacement**—250.4 cu. ins. **Rated HP**—30. **Developed Horsepower**—117 HP at 3800 RPM. **Compression Ratio**—6.5-1 standard cast-iron head. 7.0-1 cast-iron head optional. **Compression Pressure**—105 lbs.@150 RPM (Std.hd). *See Studebaker Shop Notes for Cyl. Head Installation.* **Vacuum Reading**—Steady 18-20" idling at 8 MPH.

PISTONS:—Aluminum alloy, T-slot, cam ground, tin plated. **Length** 3¾". **Weight** 13.6 ozs. (stripped). **Removal**—Pistons and rods removed from above. **Clearance**—Top .0115-.0165". Skirt .0015" selective. **Original Bore & Piston Sizes, Replacement Pistons:**—*See Studebaker Shop Notes for sizes and markings.* **Fitting New Pistons:**—Insert .003" x 1" feeler between piston and wall on camshaft side (pin parallel to crankshaft, T-slot away from camshaft). Pull to withdraw feeler 7-15 lbs. NOTE—Cylinders out-of-round or taper over .002" should be reconditioned. **Installing Pistons:**—T-slot away from camshaft.

PISTON RINGS:—3 coated rings, all above pin. #1 and #2 Compression (install with step down). #3 Oil Control (slotted type with expander ring installed behind this ring). Heat dam groove (no ring) above top ring groove. Oil drain holes in bottom groove.

Ring	Width	End Gap	Side Clearance
Compression	⅛"	.013-.021"	.0015-.002"
Oil Control	3/16"	.013-.021"	.0015-.002"

Replacement Rings:—Std. & .010", .020", .030" oversize.

PISTON PIN:—**Diameter**—⅞". **Length**—2⅝". Pin locked in connecting rod by lock screw. **Pin Fit in Piston**—.0001-.0003" clearance or light finger-push fit at room temperature (70°). **Replacement Pins:**—Std. & .002", .005" oversize. Use Hone No. PH-1 to obtain proper piston fit. NOTE—Replacement pistons fitted with pins.

CONNECTING ROD:—**Length**—8". **Weight**—32 ozs. **Crankpin Journal Diameter**—1.87425-1.87525". **Lower Bearing**—Precision type, removable steel-backed, lead-bronze lined. **Clearance**—.00075-.00275". **Sideplay**—.005-.009". NOTE—Turn crankpins for bearing clearance (Tool No. 1C). Do not ream bearings. **Bearing Adjustment:**—None. Replace bearings. Furnished Std. and .005", .010", .020" undersize. Align oil hole in rod and bearing shell. See that tongues on bearing engage grooves in rod and cap. *See Studebaker Shop Notes for 'Palnut' installation.* **Installing Rods:**—Oil hole toward camshaft.

CRANKSHAFT:—9 bearing, 12 bolted counterweights. Vibration damper mounted on forward end of shaft. *See Studebaker Shop Notes for Vibration Damper data.* **Journal Diameters**—2.3435-2.3440". **Bearings**—Removable steel-backed, babbitt-lined. **Clearance**—.001-.003". **Adjustment:**—None (no shims). Replace bearings (furnished Std. and .010", .015" undersize). **End Thrust:**—Thrust plate assembled between front bearing and crankshaft gear. Controlled by pinned bronze washers (furnished .003", .005", .007" thick) between plate and journal face. **Endplay**—.003-.006". NOTE—Install new seals (specially treated wood) whenever rear main bearing cap replaced.

CAMSHAFT:—Six bearing with helical gear drive. *See Studebaker Shop Notes for Camshaft removal.* **Journal Diameters:**—#1, 1.935-1.9355"; #2, 1.90275-1.9035"; #3, 1.87225-1.873"; #4, 1.84075-1.8415"; #5, 1.80975-1.8105"; #6, 1.74725-1.748". **Bearings**—Split steel-backed, babbitted bushings. NOTE—Align bushing with oil hole in block. **Clearance**—.00075-.00225" (#1), .002-.00375" (others). **End Thrust:**—Taken by thrust plate assembled on front face of engine behind camshaft gear. Spacer assembled back of gear hub. **Endplay**—.004-.008" **Timing Gears:**—Crankshaft (cast-iron), Camshaft (Celeron with steel hub). **Backlash**—.001-.003". *See Studebaker Shop Notes for Gear Removal and Replacement Gear Size selection.* **Camshaft Setting:**—Mesh marked camshaft gear tooth between two marked teeth on crankshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 13/32"	11/32"	5 7/32"
Exhaust	1 9/32"	11/32"	5 7/32"

	Seat Angle	Lift	Stem Clearance
All Valves	45°	11/32"	.001-.003"

Tappet Clearance:—.016" (cold) all valves. Remove hood side panel for access to valves. **Valve Guides:**—Pressed in block from above (1 5/16" below upper edge of valve seat) with stepped end down. Ream to inside diameter of .343-.344". **Valve Springs:**—Install with closed-coil up and dampener on top of spring. Replace springs if 10% weak (test with Tool U-15). **Free Length**—2½". *See Studebaker Shop Notes for Valve Spring installation.*

	Spring Pressure	Spring Length
Valve Closed	54-60 lbs.	2 3/32"
Valve Open	125-135 lbs.	1¾"

Valve Lifters:—Mushroom type in bolted-on guide brackets (clusters of four). Assemblies may be removed through valve opening on side of engine. **Valve Timing:**—See Camshaft Setting above. **Intake Valves**—Open 15° BTDC. Close 49° ALDC. **Exhaust Valves**—Open 54° BLDC. Close 10° ATDC. **Valve Timing Check**—With .020" tappet clearance #1 intake valve should open with #1 piston 15° or .0915" BTDC with vibration damper mark 'IN.OP.1-8/' aligned with pointer on timing gear cover. Reset tappet clearance .016" (cold).

LUBRICATION:—Pressure (pump in crankcase). *See Studebaker Shop Notes for Oil Pump installation.* **Normal Oil Pressure:**—40 lbs. at 25-30 MPH. **Oil Pressure Relief Valve:**—On lower right front corner of engine. Opens at 40 lbs. To adjust, loosen locknut, turn adjusting screw to right to raise pressure, to left to decrease pressure. **Crankcase Capacity:**—8 quarts.

COOLING SYSTEM:—**Capacity**—15 quarts. **Water Pump:**—Packless, sealed ball-bearing type. *For complete data, refer to 1941 Mech. Equip. Index.* **Removal**—Drain water, remove fan belt, fan blades and pulley, pump hose, and pump mounting screws. **Thermostat:**—Fulton. In cylinder head outlet. **Setting**—Starts to open 151° F. to 155° F.

CLUTCH:—**Inland.** 'Diaphragm' type, single plate, dry disc type with Long 9½CF-CS driven member. *For complete data, refer to 1941 Mech. Equip. Index.* **Facings**—Spirally grooved. Moulded (flywheel side). Woven—Man. Hycoe (pressure plate side). Inside Diam. 6". Outside Diam. 9½". Thickness .125". **Adjustment:**—Free travel 1" (min.). Turn adjusting sleeve on pedal connector link. **Hill-Holder (NoRol) Note**—Check whenever clutch pedal adjusted. Set so that Hill-Holder releases just as clutch engages (change rod length). **Removal:**—Remove transmission (see below). Support engine at rear, disconnect rear engine mountings, remove clutch housing. Take out 6 mounting screws in clutch cover flange. Lift off cover assembly. **Replacement Clutch Note**—Clutch assemblies have three spacers installed (one at each driving lug) which must be removed after clutch installed. *See Studebaker Shop Notes for Clutch Release Shaft Lubrication instructions.*

TRANSMISSION:—**Warner.** Model AS1-T86D (Std.), AS2-T86D Type R7C (optl. overdrive with electrical 'kick-down' control). All helical gear type, synchromesh (second & high), sliding gear (low & reverse). *For complete data, refer to 1941 Mech. Equip. Index.* **Transmission Control:**—Mechanical steering col. shift. *For complete data, refer to 1941 Mech. Equip. Index.* **Removal:**—Disconnect rear universal and withdraw propeller shaft from transmission. Disconnect shift levers and speedometer cable at transmission. Remove transmission-to-clutch housing capscrews, remove transmission. **Overdrive Note**—On cars with overdrive, disconnect overdrive control cable and solenoid wires. Disconnect Overdrive Rear Support at frame ends. *See Studebaker Shop Notes for Overdrive Rear Support installation instructions.*

UNIVERSAL JOINTS:—**Spicer Model 1268-102.** Needle bearing type. Two used. *For complete data, refer to 1941 Mech. Equip. Index.* NOTE—1 piece driveshaft used. Slip joint formed at rear of transmission ahead of front universal.

REAR AXLE:—**Spicer Model 41-2.** Semi-floating, Hypoid gear type with Hotchkiss drive. *For complete data, refer to 1941 Mech. Equip. Index.* **Ratio**—4.55-1 Std., 4.82-1 Optl. (Std. on Overdrive). **Backlash**—.005-.007". Shim adjustment. **Removal:**—Hoist rear of car, disconnect propeller shaft at rear universal, hydraulic brake lines, brake cables, and shock absorbers. Remove spring U-bolts, disconnect rear spring shackles and withdraw axle. NOTE—Use Puller HM-931 to remove axle shaft, Handle J-270-1 and disc J-270-6 to install inner shaft oil seal. **Wheel Bearing Adjustment:**—Shims between backing plate and axle housing. With wheel and hub removed (use Hub Puller ST-500) check endplay with dial indicator. To adjust, remove backing plate, add or remove shims (.003", .005", .010", .030" thick). **Endplay**—.001-.005".

SHOCK ABSORBERS:—**Houdaille, Model BBFS2 (front), ACHS2 (rear).** Double acting, hydraulic, adjustable type with thermostatic control (rear only). *For complete data, refer to 1941 Mech. Equip. Index.*

STEERING:—**Steering Gear**—Ross Model T-14. Cam-and-Twin lever type. *For complete data, refer to 1941 Mech. Equip. Index.* **Front Suspension:**—Planar type independent suspension with transverse spring. Specifications below apply with car weight on wheels but without load. *For complete data, refer to 1941 Mech. Equip. Index.* **Kingpin Inclination**—5½°. **Caster**—Negative ¼° to Positive ¾°. **Camber**—¼° to ¾°. Shim adjustment. **Toe In**—1/16-⅛". Adjust right reach rod only for toe-in. Left rod should be adjusted first for left wheel straight-ahead position (steering wheel centered). **Steering Geometry (toe-out on turns)**—Inner wheel turned 22-22½°. Outer wheel 20°.

BRAKES:—**Service.** Lockheed hydraulic, double anchor type. Hand lever applies rear service brakes. *For complete data, refer to 1941 Mech. Equip. Index.* **Wheel Cylinders**—Stepped or two-stage bore type. **Drum**—Budd composite. Diameter 11". **Lining**—Moulded. Width 2¼". Thickness 3/16". Lgth. per shoe (each wheel): 11⅛" front, 8 9/16" rear. **Clearance**—.010" toe (top), .005" heel, for each shoe. **Braking Power**—45% rear wheels, 55% front. **Hill-Holder (NoRol):**—Standard equipment. *For complete data, refer to 1941 Mech. Equip. Index.*

HOOD LOCK:—Alligator type hood. Hood lock control on instrument panel to left of headlight switch.

SERIAL NUMBER:—First number 441-5001 (Americar and Pick-up), 441-P-5001 (Panel Delivery). On plate on frame front cross-member (All Models), and on right side of cowl under hood (Americar and Pick-up), right front door riser (Panel Delivery).

ENGINE NUMBER:—First number same as Serial No. Stamped on right front upper corner of engine.

ENGINE SPECIFICATIONS:—4 cylinder, 'L' head type.

Bore—3⅛". **Stroke**—4⅜".

Displacement—134.2 cu. ins. **Rated HP**—15.63.

Developed Horsepower—63 (Americar—cast-iron hd.), 65 (Americar Plainsman—Al. hd.), 61 (Pick-up and Panel Delivery—cast-iron hd.) at 3800 RPM.

Compression Ratio—Cast-iron: 6.48-1 (Americar), 6.1-1 (Pick-up & Panel Del.). Aluminum: 7.0-1 (Plainsman—Optl. on other Americar models). NOTE—6.81-1 cast-iron hd. Optl. high altitudes.

Compression Pressure—At cranking speed of 185 RPM: 107 lbs. (Pick-up & Panel Del.), 111 lbs. (All others).

Vacuum Reading—Steady 21-23" idling at 8 MPH. NOTE—Cylinders offset ⅛" from center-line of crankshaft toward camshaft side of engine.

PISTONS:—Lynite Lo-Ex aluminum alloy, 'T' slot, Cam ground, tin-plated type.

Weight—12.5 ozs. (stripped). **Length**—3¾".

Removal—Pistons and rods removed from above.

Clearance—.0205-.0225" top, .003" skirt.

Original Bore & Piston Sizes:—Engines and pistons graded in four .0005" steps as shown in table below and marked as follows: **Piston**—Letter stamped on head. **Cylinder Bore**—Letter stamped on top of block between valve ports and bore at center.

Grade Letter	Cylinder Bore Size	Piston Size
A	3.1255-3.1250"	3.1235-3.1230"
B	3.1260-3.1255"	3.1240-3.1235"
C	3.1265-3.1260"	3.1245-3.1240"
D	3.1270-3.1265"	3.1250-3.1245"

Replacement Pistons:—Finished pistons furnished Std. (see Table above), .002", .005", .010" oversize.

Fitting New Pistons:—Use .0025" feeler stock ¾" wide inserted between piston and cylinder wall on side opposite slot. Pull to withdraw feeler 5-10 lbs.

Installing Pistons:—Slot toward left (valve) side.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin (heat dam groove above top ring). Oil ring groove drilled for drainage.

Ring	Width	End Gap	Side Clearance
Compression	3/32"	.008-.013"	.0015-.002"
Oil Control	3/16"	.008-.013"	.0015-.002"

NOTE—Install compression ring with mark TOP up.

Replacement Rings:—Std. & .005", .010", .020", .030" OS.

PISTON PIN:—**Diameter** .8117-.8119". **Length** 2 25/32". Pin locked in connecting rod by clampscrew.

Pin Fit in Piston—.0001-.0009" clearance or light push fit at 60°F.

Replacement Pins:—Std. & .001", .002", .003", oversize.

CONNECTING ROD:—**Weight** 34 ozs. **Length** 9 3/16".

Crankpin Journal Diameter—1.9395" (1 15/16").

Lower Bearing—Spun babbitt-lined type.

Clearance—.0008-.0023". **Sideplay**—.005-.009".

Bearing Adjustment:—None (no shims). Replace or rebabbitt rods. Do not file rods or bearing caps. Rods furnished Standard and .010" Undersize.

Installing Rods:—Short side of bearing to front (#1, #3), to rear (#2, #4). Oil hole away from camshaft.

CRANKSHAFT:—3 bearing with 4 counterweights.

Journal Diameters—2.3340" all bearings.

Bearings—Removable slip-in steel-backed, babbitt-lined. Furnished Standard and .010" Undersize.

Clearance—.001".

Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.

End Thrust:—Taken by #1 front bearing. Adjustable by adding or removing shims between crankshaft thrust washer and shaft. **Endplay**—.004-.006".

NOTE—Crankshaft thrust washer furnished .002" thick.

CAMSHAFT:—4 bearing. Non-adjustable chain drive.

Bearing Type—Removable bushing (front), machined in crankcase (all others).

Bearing Clearance—.002-.0035".

End Thrust:—Taken by thrust plate behind camshaft sprocket and spring-loaded plunger in forward end of camshaft bearing against thrust stud on chain case cover. NOTE—Make certain that plunger and spring in place when replacing chain case cover.

Timing Chain:—Link-Belt. Width 1". Pitch ½". Length 47 links or 23½".

Camshaft Setting:—With #1 piston at TDC, mesh chain with sprocket marks adjacent and in line with a straightedge across the shaft centers.

VALVES:—	Head Diameter	Stem Diameter	Length
Intake	1 17/32"	.373"	5¾" (overall)
Exhaust	1 15/32"	.3725"	5¾" (overall)

	Seat Angle	Lift	Stem Clearance
Intake	45°	23/64"	.0015-.00325"
Exhaust	45°	23/64"	.002-.00375"

NOTE—Separate valve seat inserts not used.

Tappet Clearance:—.014" all valves, with engine cold. Remove hand hole in left front fender splash shield by taking out screws for valve adjustment.

Valve Guides:—Remove from above. Press new guides in (taper end up) until lower end extends ¾" below valve spring seat recess in block.

NOTE—Exhaust valve guides counter-bored on upper inner diameter to .399" diameter, 5/16" deep.

Valve Springs:—Free length 2½".

	Spring Pressure	Spring Length
Valve Closed	50 lbs.	2 7/64"
Valve Open	116 lbs.	1¾"

Valve Lifters:—Mushroom type (remove from below). Guide holes reamed in block. Serviced by reaming guide hole for .004" oversize lifter.

Lifter Diameter—.6245".

Lifter Clearance—.0005-.002".

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open 9° BTDC. Close 50° ALDC.

Exhaust Valves—Open 47° BLDC. Close 12° ATDC.

Valve Timing Check—With .020" tappet clearance #1 intake valve should open with #1 piston 9° or .039" BTDC with flywheel mark 'I.O' centered in inspection hole in right front side of engine rear support (¼" variation permissible). Reset tappet clearance at .014" (cold).

LUBRICATION:—Pressure (pump on left of engine).

Oil Pump Installation Note—Install pump with #1 piston on compression, 'TC-IGN' flywheel mark centered in inspection hole in right front side of engine rear support and distributor shaft turned so that rotor is at #1 segment in distributor cap.

Normal Oil Pressure:—40 lbs. (75 lbs. on instrument panel gauge) at 30 MPH.

Oil Pressure Regulator:—Under plug on oil pump cover. Opens at 40 lbs. Adjustable by adding or removing shims within plug above spring.

Oil Pressure Gauge:—King-Seeley Electric. K-S No. 8190 (Dash Unit), K-S No. 6425 (Engine Unit).

For complete data, refer to 1941 Mech. Equip. Index.

Crankcase Capacity:—4 quarts.

COOLING SYSTEM:—**Capacity**—11¾ quarts.

Water Pump:—Packless, sealed ball-bearing type.

For complete data, refer to 1941 Mech. Equip. Index.

Removal—Drain water, remove fan belt and fan blades, loosen radiator mounting nuts, take out pump mounting bolts and lift pump out.

Thermostat:—Harrison. In outlet elbow on head.

Setting—Starts to open 148-155° F. Fully open 173°.

Temperature Gauge:—King-Seeley Electric. K-S No. 8184 (Dash Unit). K-S No. 7000 (Engine Unit).

For complete data, refer to 1941 Mech. Equip. Index.

CLUTCH:—**Atwood Model TP28-7 (Americar), TP28-7-1 (Pick-up & Panel Delivery).** Single plate, dry disc type with new hydraulic type dampener.

NOTE—1940 type Borg & Beck driven member used on some 1941 cars.

For complete data, refer to 1941 Mech. Equip. Index.

Facings—Moulded, 2 required. Inside Diameter 5⅛". Outside Diameter 7⅞". Thickness .125".

Adjustment:—Pedal free travel ¾-1" (provides 1/16" clearance between release bearing & release levers). To adjust, change length of clutch fork connecting cable.

Removal:—Remove Transmission (see below) and flywheel bell housing. Take out mounting screws in clutch cover. Remove clutch assembly.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

TRANSMISSION:—Warner. Model AS5-T84G. All helical gear type with synchro-mesh (second and high), sliding gear (low & reverse). Overdrive with electrical 'kick-down' control Std. on Plainsmen, Optl. on other Americar models.

NOTE—Pick-up and Panel Delivery transmission equipped with shielded bearing on main drive gear. ***For complete data, refer to 1941 Mech. Equip. Index.***

Transmission Control:—Mechanical steering col. shift. ***For complete data, refer to 1941 Mech. Equip. Index.***

Removal:—Disconnect accelerator pedal from rubber socket, remove toeboards. Disconnect control rods at transmission and front universal. Remove bell housing and hole cover and disconnect clutch throw-out bearing retracting spring. Remove lower nuts on engine mounting bolts at rear of transmission, jack up rear of engine (CAUTION—See that fan blades do not damage radiator) to clear frame cross-member. Remove transmission mounting bracket and bell housing-to-transmission case bolts. Pull transmission straight back and lift out.

Overdrive Removal—Same as above plus the following: Disconnect solenoid wires and overdrive control cable at transmission. Remove overdrive rear support by taking out bolts at frame ends. NOTE—When installing overdrive rear support, install equal number of shims between frame and each end of support until bottom of overdrive case just touches rubber insulator, then remove shims equal to 3/16" thickness from each end of support to give proper compression of insulator.

UNIVERSAL JOINTS:—Detroit Series 4100. Ball-and-trunnion type with needle bearings. 2 used. ***For complete data, refer to 1941 Mech. Equip. Index.***

REAR AXLE:—Own Model 441 (Americar), Spicer Model 21-1 (Pick-up & Panel Delivery). Semi-floating, hypoid gear (Americar), spiral bevel gear (Pick-up & Panel Del.) with Hotchkiss drive. ***For complete data, refer to 1941 Mech. Equip. Index.***

Ratio—4.44-1 (Americar). 4.7-1 (Pick-up). 5.1-1 (Panel Delivery).

Backlash—.006-.008". Shim adjustment.

Removal:—Hoist rear of car. Disconnect rear universal, brake tube and cables, shock absorbers, spring U-bolts, rear spring shackles. Pull assembly to rear.

Wheel Bearing Adjustment:—To adjust, remove wheel, hub assembly, oil seal and bearing retainer. Remove shims from between retainer and backing plate to decrease endplay. **Endplay**—.004-.006" total.

SHOCK ABSORBERS:—Monroe. STANDARD 11422 (front), 11425 (rear). HEAVY DUTY 11429 (front), 11430 (rear). Hydraulic (permanently sealed assembly), direct acting, adjustable type. ***For complete data, refer to 1941 Mech. Equip. Index.***

STEERING:—Steering Gear—Ross Model T-12 Cam-and Twin lever type. ***For complete data, refer to 1941 Mech. Equip. Index.***

Front Suspension:—Own Model 441 Front Axle. Conventional 'I' beam section with Reverse-Elliott ends.

Kingpin Inclination—7½° crosswise.

Caster—3°. Adjustable by installing wedge shims between spring and spring pad on axle.

Camber—2°. Not adjustable.

Toe In—1/32-5/32". Adjustable by loosening tie rod clamp bolts and turning tie rod.

Steering Geometry (toe-out on turns)—With outer wheel turned 20°, inner wheel should turn 23°15'. Not adjustable (check for bent steering arms).

BRAKES (ALL MODELS):—Service. Bendix (Lockheed) hydraulic, double anchor type. Hand lever applies rear wheel service brakes. ***For complete data, refer to 'Lockheed Double Anchor' Brake in 1941 Mechanical Equipment Index.***

Drums—Nickel chromium alloy iron. Diameter 9".

Lining—Moulded type. Width 1¾". Thickness 3/16". Length per wheel 18⅝".

Clearance—.008" toe (top), .005" heel, for each shoe.

Braking Power—43% rear wheels, 57% front.

Hand Brake:—See Service Brakes above.

AUTOMATIC VALVE TAPPET TAKE-UP 1941

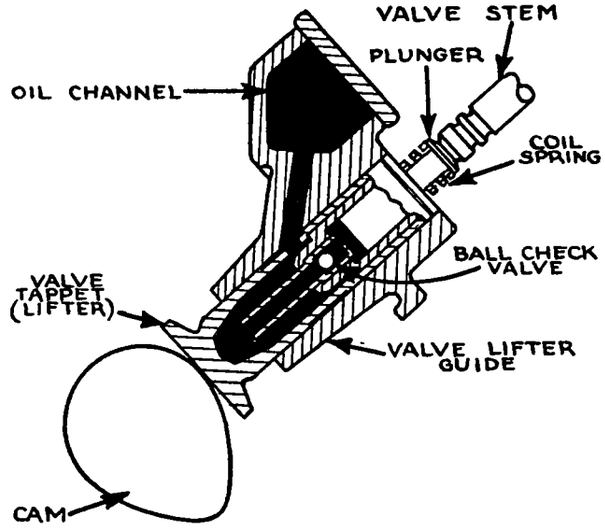
WILCOX-RICH ZERO-LASH HYDRAULIC TYPE

Used On:

CADILLAC, 41-60S,61,62,63,67,75 (1941)
LINCOLN, MODELS 16H, 168H (1941)
PACKARD SUPER 8, 1903,3A,4,5,6,7,8 (1941)

DESCRIPTION:—This type automatic take-up is hydraulically operated and is built inthe valve lifter or tappet (engines are 'L' head type). The conventional tappet clearance adjusting screw is not used and the lifter plunger contacts the end of the valve stem directly. The lifter is made in two parts; a lower or lifter section (mushroom or barrel type) which contacts the camshaft cam, and an upper or plunger section which contacts the end of the valve stem. The plunger fits into a cylinder in the head of the lifter body and is raised to contact the valve stem end by a spring under the plunger head. Oil from the pressure lubricating system of the engine flows through the oil reservoir in the lifter bracket and the oil passage in the lifter body to fill the cylinder below the lifter plunger. When the lifter is raised by the cam to open the valve, the ball check valve in the bottom of the cylinder closes, preventing the escape of oil from the cylinder and the cam motion is transmitted directly through the lifter to open the valve. The combination of plunger spring (to take up any clearance between lifter and valve stem end) and oil trapped in the plunger cylinder by the check valve (so that cam pressure is transmitted solidly through the lifter assembly) result in an entirely automatic take-up with positive valve opening action.

SERVICING:—**Removal.** On mushroom lifter types with removable brackets, disconnect oil supply tube (when external oil line used), take out capscrews in each lifter bracket, lift bracket out taking care that lifters do not fall out of bracket (on some installations, lifters prevented from falling through bracket by locking ring at upper end of cylinder). On barrel type lifters which operate in guide holes in block (no guide brackets), lifters may be removed from upper end after valves and springs removed. NOTE—Mushroom type lifters are used on Cadillac and Packard engines, Barrel type lifters on Lincoln engines.



Disassembly. On mushroom types, remove locking ring at top of cylinder, withdraw lifter unit from below. Pull plunger and cylinder assembly out of lifter body. Unlock plunger spring by twisting plunger, pull plunger and spring out of cylinder (plunger is selective fit in cylinder and must be re-installed in same cylinder). Ball check valve in bottom of cylinder may be unseated if necessary by using small blunt tool.

Servicing—Wash all parts in gasoline, wipe with soft cloth or dry with air (air hose must not be held closer than 2"). If plunger or cylinder scored or clearance excessive, replace as a unit (old lifter body may be used if clearance in bracket or block guide holes not excessive). Check ball check valve tightness (see Testing). Ball should rattle when unit is shaken. Clean out oil reservoir and oil passages in brackets and engine block. See that plunger spring has sufficient tension so that force of 6-7 lbs. required to compress spring (valve unit must be dry when making this test—see also 'Plunger Fit in Cylinder' in Testing section below).

Reassembly—Place plunger spring on plunger, insert plunger in cylinder, lock spring in cylinder by twisting plunger. Make certain that same plunger and cylinder used together (plungers must not be interchanged). Install plunger and cylinder assembly in lifter, insert lifter assembly in bracket and install locking ring at upper end of lifter body above bracket (when used).

Installation—Valve lifters should be installed without oil in the cylinder (mechanical clearance must be checked if new parts installed or valves serviced) and engine should be run to quiet valve action (may require running for as long as an hour, if oil seals off air escape between plunger and cylinder before all air expelled, valve may not quiet until oil is warm—if more than one hour required to quiet valves, check as directed under Trouble Shooting below). Connect oil supply pipes at supply end only and crank engine until all air expelled and pipes filled with oil before connecting to lifter brackets.

Cadillac Note—Lifters can be installed in engine filled with oil if special tool J-827 used which prevents pumping and introduction of air while lifters being installed. Oil should be applied to tops of lifter assemblies after they are installed.

Checking Clearance—When new parts installed or valves reseated, check clearance between plunger and valve stem with plunger held down at bottom of stroke (no oil in cylinder). Clearance must be .030-.070". If clearance less than .030", grind off lower end of valve stem slightly.

Cadillac V8 Note—Use tool J-1055 to check valve stem length before installing lifters (measures distance from heel of cam to valve stem). Grind off end of valve stem until tool slides into place. Use tool J-827 to compress plunger springs when installing lifter bracket assemblies.

TESTING:—***Plunger Fit in Cylinder.*** With all oil washed out and unit dry, pull plunger up to release spring from counterbore in cylinder, raise plunger as high as possible while still guided in cylinder, push plunger down into cylinder quickly and release. If unit holds air to extent that plunger tends to bounce back when released, clearance is satisfactory. **Plungers are selective fit in cylinders and must not be interchanged** (clearances cannot be measured directly).

Check Valve Tightness. Check by filling cylinder with kerosene and noting rate at which this leaks past the ball check valve. Maximum allowable leakage is 1 drop per second.

Cadillac Note—This leak-down rate may be tested with special tester J-1297 and adapter J-1297-41. To make this test install adapter J-1297-41 in right hand socket of tester, fill reservoir with #1 grade kerosene, release ball check and pump tester in inverted position until all air expelled. Insert special master unit in left socket of tester and engine unit being tested in right socket. Rest tester handle weight on beam pilot and set indicator at zero. Press down quickly on handle several times and note indicator reading. Pointer must stay at zero or move up (indicating engine unit equal or better than master unit). If pointer goes down (leak-down rate greater than master unit), lifter should be replaced.

Engine Oil Pressure. Oil pressure at lifters not ordinarily indicated by instrument panel oil pressure gauge (reduced by metering restriction, etc. in oil lead to lifters). Pressure at lifters should be 4 lbs. minimum at idling speed, 12 lbs. minimum at high speed. Pressure in excess of 55 lbs. may cause noisy valve operation. Check by connecting pressure gauge in lifter oil line (where external oil lines to lifters used, disconnect line; on Lincoln Zephyr remove plug between banks at rear of engine directly above lifter metering hole.

TROUBLE SHOOTING:—If operation not satisfactory, check as follows:

All Valves are Noisy.

NOTE—Hydraulic lifters should be installed without oil and operation will not be quiet until engine has been run for a short time. Oil in lifters when installed will hinder this quieting operation.

1. **Oil Level Low**—Oil level in crankcase must not be allowed to become excessively low which may permit air to enter pump inlet.
2. **Oil Level High**—Oil level in crankcase should not be above 'Full' line on indicator. Higher level may cause foaming.
3. **Oil Pressure Low**—Oil supply to lifters will be inadequate. Must be sufficient to replace normal relief leakage between plunger and cylinder. Check oil pressure (See Testing above).
4. **Oil Pressure High**—High pressure may lift entire hydraulic unit against plunger spring tension causing excessive wear. If noise particularly noticeable when oil is hot, check pressure in oil supply line at lifter assembly (See Testing above).
5. **Oil Supply Insufficient**—Examine supply pipes and connections for leaks or restrictions preventing proper flow of oil to lifters. Check for dirt or sludge clogging oil lines and clean out all oil channels.

Valves Noisy when Hot.

1. **Oil Pressure Low**—Check oil pressure at lifter units by connecting gauge in supply line at lifter bracket.

One or More Valves Noisy.

1. **Incorrect Clearance**—Check mechanical clearance for particular unit (see directions above). Check clearance between plunger and cylinder (if parts interchanged, replace as a unit), check clearance between cylinder and lifter body.
2. **Sticking Caused by Dirt or Grit**—Disassemble and clean units as directed above. Drain crankcase, clean oil pan, flush engine, refill crankcase with new oil to prevent repetition of trouble.
3. **Weak Plunger Springs**—Will permit excessive plunger movement and wear. Disassemble lifter unit and check spring. See Testing above.

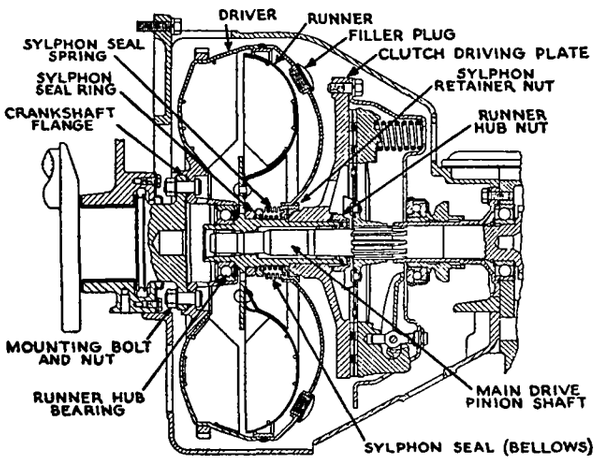
CHRYSLER, DE SOTO, DODGE TYPE

Std. or Optl. On:
CHRYSLER 6, MODEL C28 (1941)
CHRYSLER 8, MODELS C30, C33 (1941)
DE SOTO, MODEL S8 (1941)
DODGE, MODEL D19 (1941)

NOTE:—Fluid drive is used singly with conventional transmission or in combination with Vacamatic Underdrive Transmission (Chrysler 6), Vacamatic Overdrive Transmission (Chrysler 8), Simplimatic Underdrive Transmission (DeSoto). See separate articles for Clutch and Transmission data.

TYPE:—Same design as used on 1940 models except for new type runner hub nut on Chrysler 6, DeSoto, and Dodge models. This nut, which retains clutch driving plate on runner hub, is threaded in end of runner hub and does not incorporate an oil seal as used on Chrysler 8 models. Driver flange plug is used on all models although design is slightly different on Chrysler 6, DeSoto, and Dodge cars.

Bellows Seal Assembly—Consists of a floating carbon-graphite seal ring between the bellows seal ring and the bearing surface on the runner hub (same as 1940 type). Seal servicing is limited to replacement of seal ring and bellows assembly.



NOTE—Fluid drive oil is a light highly refined mineral oil which has uniform viscosity over wide temperature range and other types of fluid should not be substituted.

FLUID DRIVE ASSEMBLY REMOVAL & INSTALLATION:—**Removal**—Remove Transmission and Clutch (see car model 'M' pages for instructions). Use special box wrench C-589 (all models) to remove nuts on fluid drive mounting studs on forward face of crankshaft flange and pull unit back free of crankshaft flange, remove from below.

Installation—Carefully clean face of crankshaft flange and mounting face of fluid drive assembly to remove all dirt and burrs which might prevent flat, even contact of mounting faces. Install fluid drive assembly on crankshaft so that mounting studs and locating dowels enter holes properly, install nuts on studs and draw all nuts down evenly and securely.

SERVICING:—Unit is sealed and no adjustment required. Service operations are restricted to keeping unit filled with oil (inspect at end of first 1000 miles and at 15000 mile intervals in service) and to renewal of bellows seal and floating seal ring to correct oil leakage. See Removal & Installation directions below if Fluid Drive assembly being removed from car.

Checking Oil Level & Adding Fluid:—Recommended at end of first 1000 miles and 15000 mile intervals. Fluid drive case is filled to approximately 80% of volume and level should be checked as follows to prevent overfilling. Turn crankshaft until one fluid drive filler (2 plugs—180° apart) is at filler hole in upper right hand surface of clutch housing, remove filler plug. Fluid level should be even with bottom of filler plug opening. Add fluid as required (see Note below). Use new gasket on filler plug, replace plug and tighten securely (tap wrench with hammer to make certain that plug is tight).

Capacity—Approximately 6 qts. (Chrysler 6, DeSoto, Dodge), 8 qts. (Chrysler 8).

Bellows Assembly & Seal Ring Renewal:—With fluid drive unit removed from engine (see Removal directions above), remove both filler plugs and drain unit. Bend down tab on lockwasher, use special socket wrench C-607 (Chrysler 6, DeSoto, Dodge), C-541 (Chrysler 8) and remove clutch driving plate retainer nut. Mark one spline on runner hub and mating spline on clutch driving plate (to insure reassembly in correct position), use special puller C-606 (Chrysler 6, DeSoto, Dodge), C-542 (Chrysler 8) to remove clutch driving plate. Use special bellows seal spring compressing sleeve C-613 (Chrysler 6, DeSoto, Dodge), C-614 (Chrysler 8) to compress spring within bellows (use clutch driving plate retainer nut to push sleeve in to compress spring), remove spring retainer snap ring, remove nut, sleeve, and spring (CAUTION—Spring must be removed before bellows seal removed or seal will be damaged). Use special spanner wrench C-545 to unscrew bellows seal, remove bellows seal and floating seal ring.

IMPORTANT NOTE—Bearing surfaces on runner hub, seal ring, and bellows seal must be perfectly clean and free from scratches or marks and should show continuous contact over entire circumference. Bearing surfaces cannot be reconditioned and parts should be replaced if damaged (replace fluid drive assembly if runner hub bearing surface damaged).

Installation—Install floating ring and bellows seal (see that gasket in place), tighten bellows retainer securely. Install seal spring and retaining snap ring (use sleeve to compress spring so that retainer can be installed), install clutch driving plate making certain that marks on plate and runner hub are lined up, tighten clutch driving plate retainer nut securely. Fill unit with fluid (see directions above) and install in car.

CADILLAC, OLDSMOBILE HYDRA-MATIC TYPE

Used On:
OLDSMOBILE & CADILLAC 1941 MODELS WITH HYDRA-MATIC DRIVE TRANSMISSION

DESCRIPTION:—This Fluid Coupling replaces the conventional clutch on cars with Hydra-matic drive (no clutch used and clutch pedal omitted). Design is unlike other Fluid Drives in that, although the assembly is mounted in a case bolted on the engine flywheel, the drive is not direct from the engine crankshaft through the fluid drive (see Operation below). Fluid drive case is kept filled with same oil used in transmission case and oil is pumped into case by the transmission front oil pump. A return line and control valve allows the oil to circulate between the fluid drive and transmission so that temperatures are equalized and overheating is prevented.

OPERATION:—The engine drives the fluid coupling case which is bolted on the flywheel. The case is splined on a sleeve integral with the ring gear (drive gear) of the front planetary gear unit so that this gear is driven positively by the engine. This gear drives the planetary gear pinions and pinion plate (which is keyed on tubular intermediate shaft) and the rear unit or driver of the fluid coupling which is bolted on a mounting flange splined on the forward end of this tubular shaft. At idling speed, the driver rotates freely and does not transmit engine torque to the forward unit or runner of the fluid coupling. As soon as the engine speed is increased slightly (when accelerator pedal depressed to start car in motion), the fluid coupling driver causes the runner to rotate (driving through the oil with which the case is filled). The runner is bolted on a mounting flange which is splined on the forward end of the intermediate shaft (within the tubular shaft) and the engine torque is transmitted back through this shaft through the transmission to the rear wheels. NOTE—See separate Oldsmobile & Cadillac Hydra-matic Transmission article for complete description of transmission operation in each of the four forward speeds.

SERVICING:—**Lubrication**—Fluid Coupling case is kept filled with oil, and oil is automatically circulated, by pump in transmission case. Fluid coupling case is sealed and requires no attention. Fluid level of Transmission should be checked every 1000 miles (Cadillac), 2500 miles (Oldsmobile) and fluid added, if required, to maintain correct fluid level. Unit should be drained and refilled with new fluid at end of first 6000 miles and every 12000 miles aferward (Cadillac), end of first 5000 miles and every 10000 miles afterward (Oldsmobile). Check fluid as directed below (see Hydra-matic Transmission article for draining and refilling data and capacities).

Checking Fluid Level—Raise right edge of front compartment rug, remove all dirt from around inspection hole so that it cannot fall into transmission case, remove small sheet metal cover from top of transmission cover over indicator stick. Run engine for at least 1 minute, stop engine and wait 1 minute, then check level with indicator stick. Add fluid as required, to bring level up to 'Full' mark on indicator. CAUTION—Use genuine Cadillac or Oldsmobile Hydra-matic Drive Fluid only (use of other fluid voids warranty on Cadillac units).

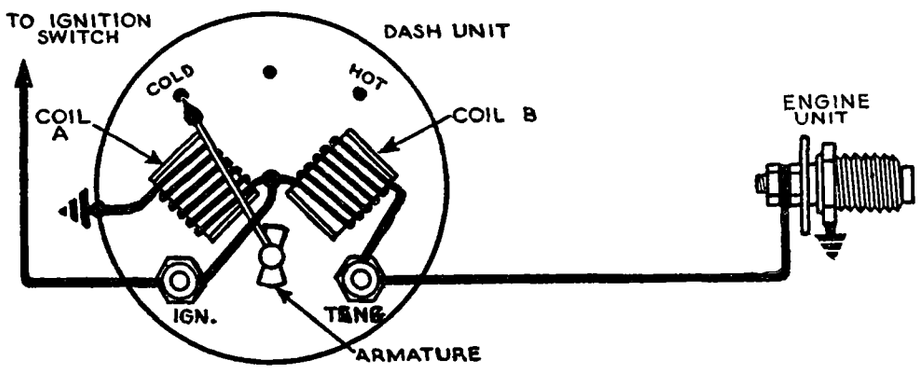
DESCRIPTION:—This is an Electric gauge of the 'balanced coil' type and consists of a Dash Unit or recording gauge and an Engine Unit or temperature reacting unit mounted in the cylinder head or engine block in contact with the cooling water in the engine. Dash unit is connected to the 'Gauge' side of the ignition switch (controlled by switch and operative only with switch on) and to the engine unit and each unit is grounded (see wiring diagram). Dash unit consists of two coils at a 90° angle with an armature (on which the pointer is mounted) at the intersection of the coil axis. One coil is connected directly between the 'IGN' (feed) terminal and ground on the gauge case, the other coil being connected between the two gauge terminals (in series with the engine unit). Engine unit consists of a fixed resistance unit which has a high resistance value Cold and a relatively low resistance value Hot (gauge operated by this change in resistance due to temperature changes in the engine—gauge engine unit has no moving parts).

Pressure Cooling Note—Gauges used on cars with pressure cooling (pressure valve in radiator filler cap) are calibrated so that dash unit reads 212° (boiling point) when the cooling system water is actually at the temperature at which water boils with the pressure at which the system is designed to operate (boiling point increase with increase in pressure) which will be somewhat higher than 212°. This is done so that the dash unit will not indicate 'boiling' before the cooling water actually reaches the boiling point and must be kept in mind if the gauge is tested by immersing the engine unit in a heated pan of water.

OPERATION:—When the ignition switch is turned on with the engine cold, current flows directly through coil 'A' to ground. The high resistance of the engine unit causes a relatively smaller current to flow through coil 'B' (which is connected in series with this resistance) so that the pointer is deflected toward the 'Low' or coil 'A' side of the scale. As the engine warms up, the resistance of the engine unit decreases, allowing an increasingly greater current flow through coil 'B' so that the pointer is drawn over toward the 'High' end of the scale. The balanced action of the two coils compensates for battery voltage variations and in addition an inertia dampener is built in the armature assembly to prevent pointer vibration on rough roads, etc.

SERVICING:—All defective units should be replaced.

TROUBLE SHOOTING:—If gauge operation not satisfactory, check as directed under correct heading in following table, being careful to turn ignition switch off when disconnecting or re-connecting leads on terminals and using extreme care not to reverse connections at dash unit terminals. Do not allow dash unit to be placed in strong electric field which will affect magnetic armature.



CONNECTION NOTE—Left hand (small diameter) terminal on dash unit should be connected to ignition switch, right hand (large diameter) terminal connected to engine unit. Terminals marked for identification.

Gauge does not register with Ignition Switch turned on:
1. Lead between Ignition Switch and Dash Unit broken or grounded (open or short-circuit). Check by connecting test lead between these two points with regular lead disconnected at both ends.

Gauge register 'Cold' under all conditions:
1. Lead between Dash Unit and Engine Unit broken (open-circuit). Check by connecting test lead between these two units.
2. Coil 'B' (right hand coil) in dash unit defective or lead to coil broken.

Gauge registers 'Hot' under all conditions:
1. Lead between Dash Unit and Engine Unit short-circuited. Check by disconnecting this lead at engine unit terminal and noting gauge reading. If gauge still reads high, this lead is shorted. If gauge reads low, engine unit is shorted and must be replaced.
2. Dash Unit not grounded. Clean all paint from under dash unit mounting flange, tighten mounting screws.
3. Engine Unit burned out. See check under (1) above or install replacement engine unit and note operation.
4. Coil 'A' (left hand coil) in dash unit defective or lead to coil broken.

Gauge registers Inaccurately:
To check, disconnect lead at engine unit terminal, remove engine unit, ground engine unit shell to car frame with test lead, re-connect engine unit, immerse inner end of unit in pan of water at known temperature (use reliable thermometer and heat water as required), note gauge reading.
CAUTION—When making this test, do not completely immerse engine unit in water which may allow leakage within shell or short-circuit lead on terminal.

AC & AUTO-LITE (MOTOMETER) TYPES

DESCRIPTION & OPERATION:—Vapor tension type temperature gauges consist of a dash unit gauge connected to an engine unit bulb by a hermetically sealed tube. The entire system is evacuated and partially filled with a liquid which has a low boiling point. When the engine unit bulb is exposed to the heat of the cooling water (bulb is installed in cylinder head or block so as to be immersed in the cooling water), the resulting expansion or vaporizing of the liquid in the gauge causes an increase of pressure which is indicated on the dash unit. Dash units are calibrated so as to read directly in degrees of temperature.

SERVICING:—No service operations required and units cannot be repaired. Replace all defective gauges as an assembly (dash unit and engine unit).

CAUTION—Do not cut tubing or attempt to disconnect dash unit or engine unit. The entire assembly is a sealed unit and will not operate satisfactorily if disturbed.

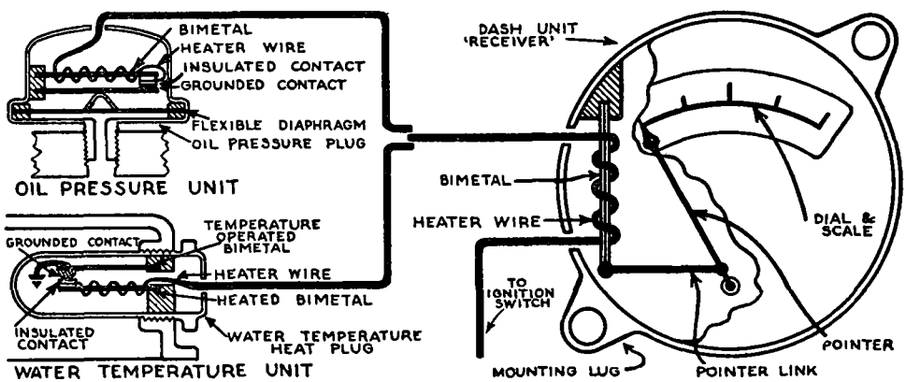
REMOVAL & INSTALLATION:—When removing gauge for work on engine or other parts of car, use extreme care not to kink or damage connecting tubing or to distort engine unit bulb which would cause dash unit to read incorrectly. Tubing should not be bent at sharp angles (loop tubing where change in direction required) and must not be flattened or kinked. When installing new gauge do not attempt to remove excess tubing (form tubing into fairly large loop).

OIL PRESSURE GAUGE

DESCRIPTION:—This is an electric oil pressure gauge comprising an engine unit, and a dash or recording unit connected by a wire. The dash unit is also connected to the ignition switch (gauge operative only with engine turned on) and the gauge circuit is completed to ground through the engine unit contacts. The dash unit consists of a thermostatic bi-metal arm linked to the instrument pointer around which is wound a heating coil. The engine unit has a similar bi-metal arm and heating coil. One of the engine unit contacts is mounted on this bi-metal arm and the other contact is mounted on a diaphragm which is deflected when oil pressure is built up in the engine so as to increase the contact pressure and lengthen the time period over which the contacts are closed. The diaphragm contact completes the gauge circuit to ground.

OPERATION:—When the engine is operated and oil pressure is built up, the pressure deflects the diaphragm in the engine unit and, with the contacts closed, a current flows through the heating coils of the dash and engine unit. The heating effect of the coil in the dash unit tends to bend the bi-metal arm which is linked to the pointer and record a reading on the gauge. At the same time, the heating coil in the engine unit causes the bi-metal arm to flex to a point where the contacts open and the current is interrupted. When this occurs the bi-metal arm in the engine unit flexes in the opposite direction and again closes the contacts. Contact pressure and length of time (amount of flexing necessary to open contacts) is directly proportionate to the oil pressure in the engine, and as this determines the amount of current flowing in the gauge circuit and the deflection of the bi-metal arm in the dash unit, the dash unit indicates the oil pressure. The opening and closing of the contacts is extremely rapid (approximately 120 cycles per minute with engine oil pressure of 25 lbs.). The dash unit is calibrated in pounds and the accuracy of the gauge is established at the time of assembly by the use of calibrating shunts.

SERVICING:—No service operations are necessary other than to see that connections are tight and that lead is properly connected to engine unit. If gauge operation is unsatisfactory, check Trouble Shooting Table and make tests outlined below. Repair or calibration of units is not practical and manufacturer recommends replacement of Receiver or Sender units which are defective.



Trouble Shooting Table

1. **Gauge pointer is erratic.** Engine unit probably defective.
2. **Gauge reading inaccurate.** Engine unit probably defective.
3. **Gauge does not register.** Engine unit defective or dash unit burnt out as result of short-circuit in lead between units.
4. **Gauge registers with engine not running (ignition on).** Short-circuit in lead between dash unit and engine unit or short-circuit in dash unit (a short-circuit of this type will usually result in dash unit burning out, resulting in no reading).

TESTING (ALL UNITS):—Use a gasoline gauge tank unit which is known to be OK. for test purposes. Connect flexible test lead to terminal on this test unit and second lead to test unit mounting flange (for ground circuit). Make tests in order as given below before removing units from car.

Testing Dash Unit Receiver. Disconnect engine unit Sender, connect test unit terminal lead to this wire, ground test unit to engine block. Turn on ignition switch. With float of test unit at bottom (tank empty) position, dash unit receiver pointer should be even with lowest mark on dial. Move test unit float rod up to top position. Dash unit receiver pointer should move to top mark on dial (allow one minute for pointer to come to rest). If dash unit receiver does not operate satisfactorily, see that connections at receiver and ignition switch are tight, check line to ignition switch and line to engine unit, then replace receiver. NOTE—When testing temperature gauges, readings will be reversed (Hot reading with test unit float at bottom, Cold reading with test unit float at top).

Testing Engine Unit Sender. If receiver tests OK. (above), see that motor unit is well grounded, disconnect and check radio condenser (shorted condenser will cause high reading on dash unit). Then replace engine unit sender, connect to dash unit receiver and note performance.

KING-SEELEY TEMPERATURE GAUGES

IMPORTANT NOTE:—**All Models.** Temperature gauges will read 'Hot' or 212° with the ignition switch turned off (engine not running). This reading does not mean that gauge is defective and is caused by the linkage design which is designed to conserve current (less current consumed when engine is at normal running temperatures). Gauge readings should only be taken with the ignition switch turned on.

Ford & Mercury 1941 Models—A temperature switch King-Seeley No. 8355, Ford No. 01A-10990, is used in the temperature gauge circuit (between the dash unit and the engine unit) so that temperature can be measured in both engine blocks. The regular engine unit or heat plug King-Seeley No. 7000, Ford No. 99A-10884, is used in conjunction with this temperature switch.

DESCRIPTION:—Dash unit or Receiver same design as for Oil Pressure Gauge. Engine Unit or Sender consists of two bi-metal arms within a heat bulb which is designed to be screwed in the engine block so that cooling water temperature is transmitted to the arms. Heating coil (connected to dash unit) is wound on one arm and connected to insulated contact at free end of arm. Ground contact is mounted on free end of second bi-metal arm which is so located that contacts are normally closed (with arms not flexed) and gauge circuit is completed through heating coil and contacts to ground when ignition is turned on.

OPERATION:—When heating coil on bi-metal arm in engine unit is energized, the temperature rise tends to flex the arm and open the contacts. This interrupts current flow, allows bi-metal arm to cool off and flex back so that contacts are again closed. This action is extremely rapid and arm has a vibrating motion. Second bi-metal arm is longer and thinner than heater arm so that flexing action, as engine temperature increases, is greater and tends to increase contact pressure and length of time contacts are closed. Consequently current flow in gauge circuit increases in proportion to the rise in engine temperature and this increased current produces a greater deflection of the dash unit bi-metal arm so that a higher reading is indicated on the dial.

TESTING & SERVICING:—Same as for Oil Pressure Gauges (above). See Note for reversed readings secured on temperature gauges when using special gas gauge tank unit as a test sender.

Used On:
BUICK, CADILLAC, CHEVROLET, OLDSMOBILE, PACKARD, PLYMOUTH, PONTIAC 1941 CONVERTIBLE CAR MODELS.

NOTE:—Power tops on all cars are of similar design with differences in power cylinder mounting, linkage design and control hook-up as noted below.

Electric & Hydro-electric Types—These types used on other car models and have direct motor driven geared power, or hydro-electric power cylinders linked to same type top mechanism. See separate articles (following) for data on these types.

DESCRIPTION:—Convertible tops used on cars with power actuation have the conventional top bows and braces modified for connection of the vacuum power cylinders and are equipped with counterbalancing springs. Two vacuum power cylinders are mounted at sides of car behind seat trim (one on each side) and are linked to the top frame. Each cylinder is double acting type, with vacuum line hose connection to upper and lower end, and operate when control valve button on dash is manipulated to connect either end of cylinder to engine manifold vacuum line (both strokes of cylinder piston rod are positive and top is both raised and lowered by vacuum power). Control valve is double acting type and is normally centered in the 'off' position by a spring within the valve. When the control valve button is pushed in, or pulled out, vacuum connection is made through the valve to one end or the other of both power cylinders. Button must be held in or out during entire time cylinders are operating to raise or lower top.

OPERATION:—Engine should be running (idle engine with closed throttle) and car should be stopped when top control is operated. CAUTION—Top should never be raised or lowered when car is in motion.

Lowering Top—Unlatch top from widshield header on both sides, raise top slightly so that locating dowels or pins are free of header, press in or pull out on control valve button (pull out on button on Buick, Cadillac, Chevrolet, La Salle, Oldsmobile, Pontiac, Packard; in, Plymouth) and **hold in this position** until top is completely lowered. In this position, control valve connects lower end of each cylinder to engine manifold vacuum line and opens upper end of each cylinder to atmospheric pressure.

Raising Top—See that top straps or boots are removed so that top is free. Press in on control valve button (Buick, Cadillac, Chevrolet, La Salle, Oldsmobile, Pontiac, Packard; pull out, Plymouth) and **hold in this position** until the top is raised. Top should come to rest within 1-2" of windshield header and side rail should be straight (see Adjustment section below). Top must then be pulled down and fastened in place by hand.

ADJUSTMENT:—**Chevrolet**—If top does not come to rest within 1-2" of windshield header and side rails do not straighten out when top is raised, or if top travel is excessive so that it comes to rest on windshield header, adjust as follows: Lower top, remove mounting screws and take out rear quarter trim panels. Loosen two nuts anchoring adjustment plate on control link bracket (directly above and forward of top of vacuum power cylinder on each side of car), tap adjustment plate down ⅛" (if travel insufficient), up ⅛" (if travel excessive), tighten anchor nuts. **Adjust both sides of car exactly alike.** Check performance, repeat adjustment until correct operation secured.

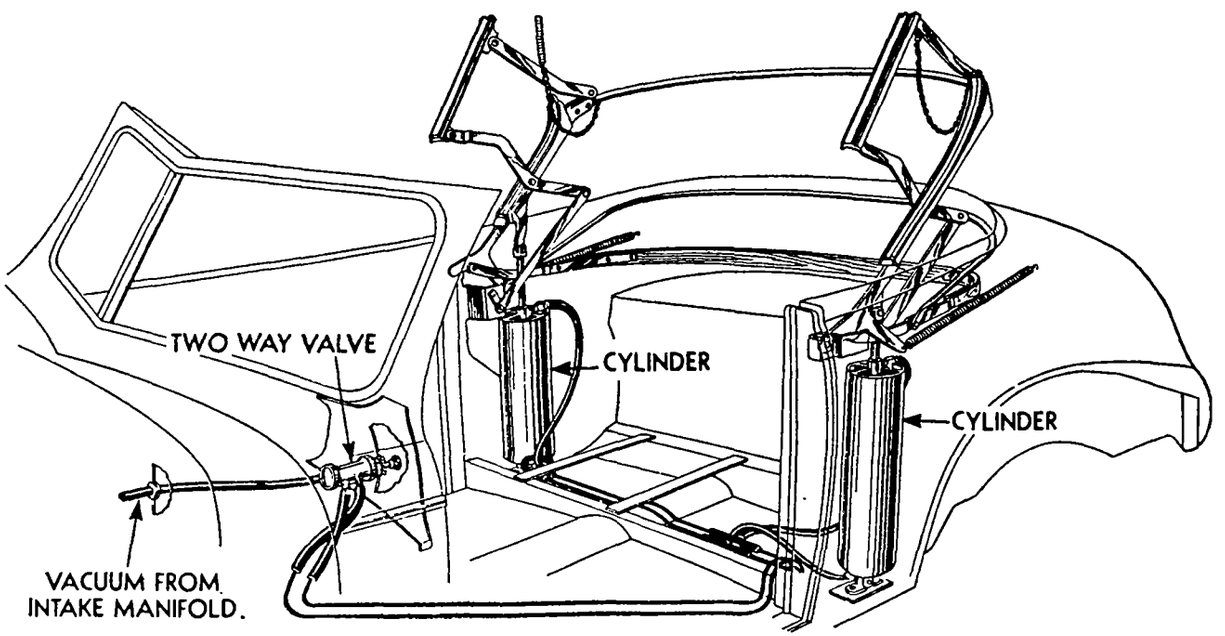
Top Alignment—Top alignment to insure correct registering of locating dowels or pins and sockets on top and windshield header can be adjusted by shimming body at mounting bolts.

SERVICING:—**Vacuum Cylinder**—To remove vacuum cylinder, remove rear quarter trim panel, take out bolt linking piston rod to top, disconnect both connections, remove bolt mounting cylinder on body bracket at lower end (on General Motors cars, remove locknut on end of bolt, then remove bolt with a 5/16" Allen setscrew wrench), lift cylinder out. When replacing cylinder, use care not to bend or distort piston rod or cylinder, make certain that cylinder and piston rod lined up between mounting bolt and top connector bolt (if cylinder out of alignment, piston rod will bind and operation will be faulty). See that vacuum line hoses are properly connected to top and bottom of cylinder.

NOTE—Use care not to reverse hose connections.

Lubricating Vacuum Power Cylinder—If piston is tight in cylinder, lubricate with half-and-half mixture of Neatsfoot Oil and Kerosene by submerging hose connection at upper end of cylinder (hose removed) in 1 oz. glass of lubricant and operating piston downward which will draw lubricant into cylinder. Work piston up and down several times.

Control Valve—To remove valve, disconnect and tag hose connections (to insure correct reassembly), remove mounting nut and withdraw valve assembly. To disassemble valve, remove large nut on stem end of valve and withdraw plunger. On General Motors cars, an air cleaner is mounted under the perforated plate on the end of the valve and is retained by a locking ring.



Vacuum Line Connections (Buick, Cadillac, Chevrolet, La Salle, Oldsmobile, Pontiac)—Rubber tubing should extend over ends of metal tubing connections 1" or more (except at control valve which should be ½"). Joints should be cemented tight with rubber cement such as Fisher F.S. 621.

TROUBLE SHOOTING:—If top does not operate satisfactorily, check the following points:

Vacuum Lines—Check all connections for leaks, see that hose connections and metal tubing are not kinked or broken. NOTE—Lines can be checked with vacuum gauge by noting gauge reading at engine manifold, and then connecting gauge to each hose connection at cylinder (hose to opposite cylinder must be plugged, and control valve button must be operated to open valve in order to secure gauge reading). See Vacuum Line connections in Servicing section above.

Vacuum Power Cylinder—Check piston rod for binding or tightness caused by lack of lubrication (see Cylinder Lubrication in Servicing section above). To check cylinder, disconnect bolt linking piston rod to top, see that piston moves freely in cylinder. Check alignment by raising top in stages, and checking piston rod in each position. Check piston rod seal for damage caused by misalignment or binding of the piston rod. A leak at the seal will cause sluggish action or complete failure of the mechanism to raise the top.
IMPORTANT NOTE—Cylinder rocks on pivot bolt as top is raised and lowered. Any mis-alignment caused by top and bottom mounting bolts not being in same plane (so that cylinder or piston rod cocked sideways) will cause binding and faulty operation.

Top Mechanism—See that top folding arm assembly operates freely without binding. This can be checked by operating top with vacuum cylinders disconnected, or by operating top manually with engine not running (operate control valve in usual manner so as to permit piston to move up or down in vacuum cylinder).

Used On:
CHRYSLER, DE SOTO, DODGE, HUDSON 1941 CONVERTIBLE CAR MODELS.

NOTE:—This hydro-electric control not same as 'Electric' type where separate electric motors are geared directly to power screws linked to the top mechanism on each side of the car. See separate article (following) for data on Electric Top Controls.

DESCRIPTION:—This type control consists of an electric motor and pressure pump assembly which supplies fluid under pressure to two double acting hydraulic cylinders which raise and lower the top. Motor operation is controlled by a switch on the instrument panel. Top design is conventional with the top bows and side-irons modified somewhat for power actuation.

Top Motor—Consists of a reversible motor mounted as an assembly on the left frame side rail with the oil pump, oil reservoir, and solenoid switches. Motor field is divided into two sections connected to separate terminals on motor frame (each section connected to one solenoid switch).

Pump & Valve Unit—Pump and valve assembly is built-in motor endplate. Pump is conventional gear type with driving gear mounted directly on armature shaft. Valve assembly consists of a double spring-loaded disc type valve which allows fluid flow from pump to one end of cylinders and at the same time allows the fluid displaced from the other end of cylinders to flow to fluid reservoir. Valves are correctly adjusted during assembly and adjustment should not be changed.

Control Switch—Switch is two-way type and is spring-loaded so that it returns normally to the center 'off' position. Switch button should be pulled out to raise top or pushed in to lower top and must be held in or out until the operation is completed.

Power Cylinders—Double acting type, 2 used. One cylinder is mounted on each side of car between trim panel and body panel with piston rod linked to the top upper hinge brace through a connector yoke. Cylinders are mounted on a pivot bracket on the car floor with flexible connections from upper and lower ends of cylinders to pressure lines on car frame which connect to valve outlets on motor and pump assembly. Same ends of both cylinders are connected to the same pressure line (upper ends to one line, lower ends to second line).

OPERATION:—Top can be raised or lowered with engine running or stopped but the **control should be operated only with car standing still to avoid damage to top.** When control switch is pulled out (and held out) to raise top, this actuates one solenoid switch which completes motor circuit through correct field section so that motor and pump operates to supply fluid to line connected to lower end of each power cylinder (left hand or lower connection on valve assembly). Fluid forces piston and rod up in each cylinder and raises the top (fluid displaced from top of cylinder flows back to reservoir through valve assembly). Top header should approach within ½" of top of windshield and top should then be pulled down over locating dowels by hand and the 3 attaching clamps fastened. When top is to be lowered, attaching clamps should first be freed (free center clamp first) and top raised free of locating dowels. Then, when control switch is pressed in (and held in), this actuates the other solenoid switch and completes motor circuit through the other field section so that the motor and pump revolve in the reverse direction to supply fluid to line connected to tops of power cylinders (right hand or upper connection on valve assembly). This causes piston and rod to move down in cylinder and lower top.

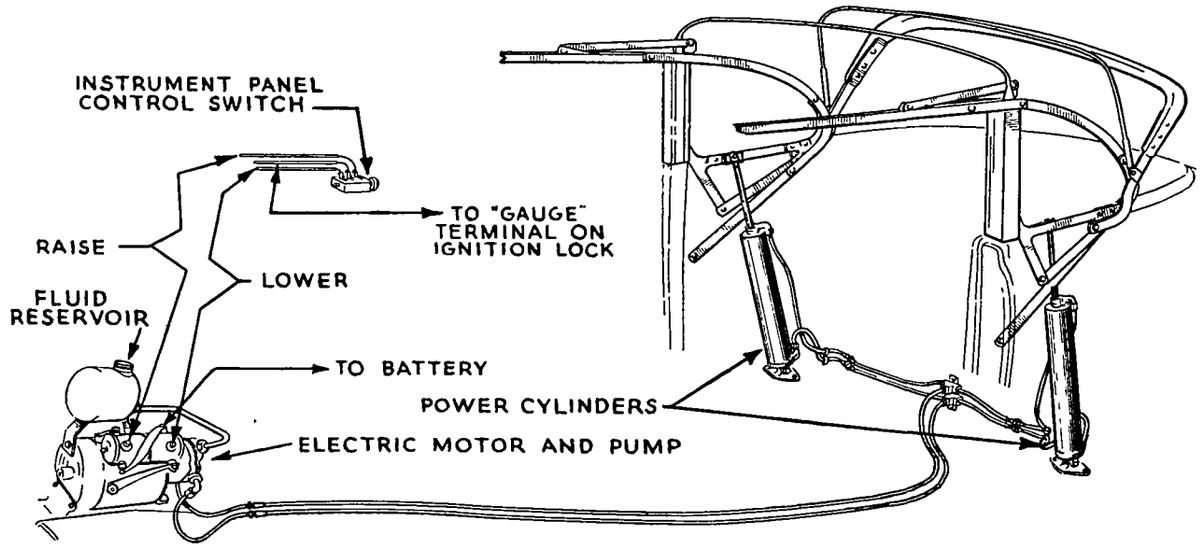
TESTING:—If top does not operate or operation is not satisfactory check as follows:

Top does not Raise or Lower Freely. When raising top, see that top is free and not obstructed or binding on body. When lowering top, make certain that header is free of locating dowels (top must be raised off dowels by hand). Check following points:

1. Top Mechanism. See that all joints in top irons are free and not binding (disconnect power cylinder piston rods and operate top by hand).
2. Power Cylinders. Check piston alignment in upper end plate (disconnect piston rod at yoke, see that rod not sprung when connecting yoke). Check cylinder floor mounting, see that cylinder free to move on bracket pivot and that pivot aligned so that cylinder and top control pivot in same place as top raised and lowered.
3. Pressure Lines. Check all lines and fittings for loose connections and fluid leaks. Check all lines and hoses for kinked or obstructed opening. Check fluid level in reservoir and make certain that tank is at least one-half full.

Top does not raise or Lower—Make certain that top not binding or obstructed in raised or lowered position (see above). Check following points:

1. If motor operates satisfactorily, check fluid level in reservoir (must be at least one-half full), check all lines and fittings for damaged pipes and fluid leaks.
2. If motor operates in one direction only, check the other solenoid switch, control switch and motor field lead, and motor field for grounds or open-circuits.
3. If motor operates slowly or not at all, check battery condition, check feed wire from ignition switch 'GA' terminal to control switch, and wires from control switch to solenoid switches and from solenoid switches to motor. See that motor grounded, check motor for worn or sticking brushes, dirty or burnt commutator, grounded or open field coils and armature coils.



SERVICING:—**Power Cylinder**—Power cylinder parts not supplied separately and cylinder should be serviced by replacement. To remove power cylinder, remove rear quarter trim panels, disconnect hose connections at top and bottom of cylinder (place hoses in container to prevent fluid running out on floor), disconnect piston rod yoke by taking out attaching screw, disconnect cylinder from floor mounting bracket by taking out cotter pin, plain washer, and clevis pin, lift cylinder out. Install cylinder in same manner and make certain that lower connection is free so that cylinder pivots freely on bracket and that hose connections securely fastened and not kinked. Expel air from cylinder by raising top part way and then working top back and forth slightly by manipulating control switch.

Power Unit—To remove complete power unit, disconnect flexible hose connections at valve assembly, take out two bolts attaching unit to left frame side rail, lift unit out. Disconnect pipe from reservoir to valve assembly.

Valve Assembly—Remove four Phillips head screws attaching valve assembly to pump body, remove assembly. To disassemble valve, remove large end fittings (power cylinder connections), gaskets, check valve springs, and check valve assemblies. See that valve seats in housing are smooth and not nicked or burred (will cause loss of pressure). CAUTION—Valves are adjusted during assembly and adjustment should not be changed.

Pump Assembly—To remove pump, take off rear mounting bracket, remove four screws and lockwashers mounting pump housing on end of motor (if rear solenoid interferes, loosen two solenoid attaching screws). Pull pump assembly off motor housing (armature will come out with pump). Pump drive gear is keyed to armature shaft and can be removed by tapping on end of shaft, then remove gear and key. Lift driven gear off shaft. If oil seal is being replaced, old seal should be turned out in a lathe and a new seal pressed in place. Reassemble pump in same manner **using all new gaskets.**

Motor—Motor is Auto-Lite unit similar to starter motors (except for special field) and is serviced in same manner as starter motors.

Used On:
CHRYSLER, DE SOTO, DODGE, FORD, LINCOLN, MERCURY 1941 CONVERTIBLE CAR MODELS

Auto-Lite Equipment List

Car Model	Top Motors	Control Relay
Chrysler C28,C30('41)	EWG-4002	HRF-4001
DeSoto S8 (1941)	EWG-4002	HRF-4001
Dodge D19 (1941)	EWG-4002	HRF-4001

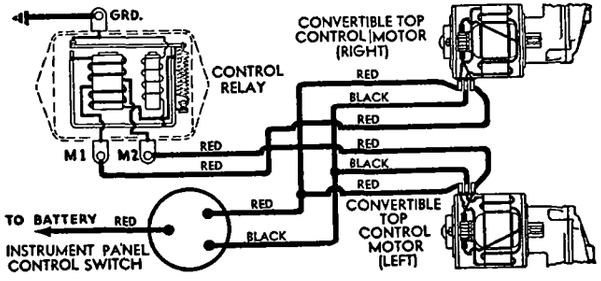
DESCRIPTION & OPERATION:—This type control control consists of two electric motors each mounted as a unit with its worm-and-gear type power screw at sides of car with the power screw linked directly to the top frame (conventional top bows and braces are modified for this power connection). Motors are reversible and are controlled directly by a switch on the instrument panel so that they operate to raise or lower the top when the switch is actuated. A control relay is connected in the circuit to protect the motors from unequal loading which would cause damage to motors and top.

Motors—Series wound type with field connected in two sections to separate terminals on motor frame. When the control switch is actuated one-half of the field is energized which causes the motor to revolve in the correct direction to raise or lower the top. The motors are geared directly to the power screw which is connected to the top frame.

Control Switch—Consists of a two-way switch which is spring-loaded so that it is normally in the 'off' position and must be held in the 'up' or 'down' position while the top control is operating.

Control Relay—Relay has two opposed windings, one of which is connected in series with each top control motor. This results in relay contacts remaining closed as long as load and current of each motor is equal. A differential of 20-30 amperes between the two motor circuits (caused by binding or obstruction on one side of top) causes relay contacts to open so that the motors stop.

Circuit Breaker—On control switch. Protects motors and relay from overload. Circuit breaker kicks out in one minute or less with current of 80 amperes.



SERVICING:—To check operation of top, disconnect top from power screw, see that folding arm assembly works freely without binding at any point. Check control switch to make certain that circuits are completed through switch in 'up' and 'down' positions. To check power screw for sticking or binding, remove motor (see below) and operate screw by inserting screwdriver in slot in pinion shaft. Shaft should turn easily and freely. If it does not, check for bent power screw. See that power assembly is not binding on base pivot (entire assembly must pivot on this pivot screw as top moves up and down).

Power Unit—To replace power unit, remove trim side panels in rear seat compartment, disconnect motor wires, remove bolt linking power screw to top and pivot bolt in mounting bracket, lift out power screw and gear box assembly. Install new assembly in same manner, taking great care not to kink or bend the power screw and see that power screw installed in top bracket so that it is perfectly straight between top attaching bolt and body mounting pivot bolt. Connect motor leads and check top operation before replacing trim panels.

TESTING:—If top control does not operate satisfactorily, test each unit as follows:

Control Switch—Disconnect motor leads at switch. Connect one test lamp lead to ground, touch other lead to switch 'up' terminal, place switch in 'up' position. Lamp should light. Test 'down' terminal in same manner.

Top Motor—Disconnect guide mechanism from top slat irons and operate motors. If motors do not run freely when disconnected, check motor brushes for sticking or wear, see that commutator clean and not burnt, check field coils for grounds and open-circuits.

Motor Performance
(Auto-Lite EWG-4002)

Load	Amperes	Volts
No Load	11	6
Normal Load	20-40	6
Stalled	105	6

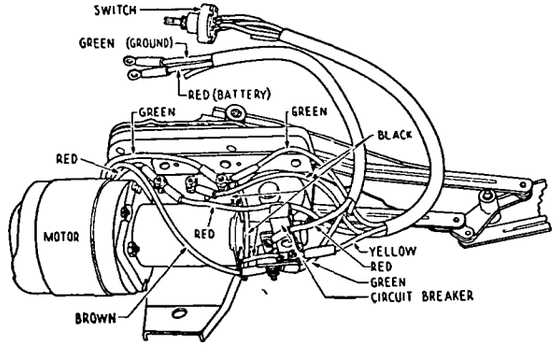
NOTE—Operating voltage is 4.5-5 volts and stalled torque should be 15 oz. ft.

Control Relay—If motor does not operate with switch in up or down position, ground relay terminals. If motors run, check relay contacts. If contacts are open and motors run when contacts held closed, check motors for unequal load (relay should operate in this manner if motor loads unequal). If relay buzzes and contacts do not hold open, check relay voltage coil for open-circuit.

Relay Specifications
(Auto-Lite HRF-4001)

Contacts Open—25-35 amperes through either series winding at 5.0 volts (or 20-30 ampere differential between both coils). Opening amperage for each coil must be equal within 2 amperes. Adjust by bending lower spring hanger.
Contacts Close—.2 volt minimum.
Air Gap—.030-.034" with contacts closed. Measure between current coil (series winding) core and armature. Adjust by shifting upper stationary contact up or down. CAUTION—See that both sets of contacts open and close simultaneously.
Contact Servicing—Clean contacts with strip of clean linen tape moistened with carbon tetrachloride and then rub with clean dry tape (draw tape through between contacts). If contacts burned or pitted, resurface by filing lightly with very fine contact file (ST-290) parallel and lengthwise of armature and then clean contacts as directed above. See that no lint is left on contact surfaces.
Voltage (Shunt) Winding—Winding resistance is 4.68-5.18 ohms. Measure between stationary contact and movable contact with contact points held open.

STEWART-WARNER ELECTRIC WINDSHIELD WIPER



Model 645-E.
Packard Clipper, Model 1951 (1941)
Packard '110' Six, Model 1900 (1941)
Packard '120' Eight, Models 1901,1A (1941)

DESCRIPTION:—Windshield wiper consists of an electric motor and gear driven crank arm linked to two wiper arm assemblies mounted on the cowl at the lower edge of the windshield. Motor assembly includes an off-on control switch, a Dynamic Breaker mechanism which causes motor to stop in the correct parking position when the switch is turned off, and a new Klixon type circuit breaker to protect the motor and circuits. Design differs from type used on 1940 models mainly in that wiper arm linkage has been redesigned and that new circuit breaker replaces fuse used on previous type.

Klixon Circuit Breaker—Thermostatic type circuit breaker mounted on dynamic breaker housing. Circuit breaker is not adjustable.

ADJUSTMENT:—**Parking Position**—Both blades should park evenly at base of windshield when control switch is turned 'off' (within several strokes after switch operated). If blades do not park properly or if blades are not synchronized, adjust linkage as follows:

Parking Adjustment—Loosen each wiper arm nut several turns to free arm on shaft. With control switch turned off, move each wiper blade to correct parking position and tighten slotted head nut securely. CAUTION—Some clearance should be provided between blades and edge of windshield at lower end of stroke to prevent pounding when windshield wiper is operated.

Wiper Blade Replacement—To remove blades, hold arm away from glass slightly and pull blade out. Install new blade in same manner.
CAUTION—Do not move arm away from glass further than required to remove blade to avoid damage to spring within wiper arm.

SERVICING:—**Lubrication**—No lubrication required in service. Motor bearings are oilless type and gears are lubricated for life when assembled.

Dynamic Breaker—Can not be adjusted or repaired in the field and should be serviced by replacement only. Do not dismantle Dynamic Breaker

Motor—Motor can be disconnected from gear housing by disconnecting lead and taking off nuts on mounting studs. Average motor current consumption is 4 amperes.

Std. Equipment On:

Car Model	Model No.
Chrysler C28, C30 (1941)	EWD-5001, EWD-5003
Chrysler C33 (1941)	EWD-5001
DeSoto S8 (1941)	EWD-5001, EWD-5003
Dodge D19 (1941)	EWD-5001, EWD-5003
Plymouth P11,P12('41) Spec'l	EWD-5001, EWD-5003
Studebaker 11A Comm. (1941)	EWD-5002
Studebaker 7C Pres. (1941)	EWD-5002

NOTE—Model EWD-5003 is used on Chrysler, DeSoto, Dodge & Plymouth Convertible Coupe models only.

DESCRIPTION & OPERATION:—Two-speed type of same general design as used on 1940 models except for new wiring diagram (see illustration) and new simplified 'Parking' mechanism as follows:

Parking Switch—Consists of a simple pushbutton type switch mounted on a bracket on the drive gear housing and actuated by a cam on one of the crank-arm shafts. When control switch is turned 'off' motor circuit is completed through parking switch and motor continues to operate until the blades reach the parking position when the cam strikes the pushbutton and opens the switch. Switch bracket is adjustable (see Parking Angle Adjustment below).

Motor Resistor—Consists of a carbon block resistor in the drive gear housing (see illustration) which is connected in the field circuit. In the low speed position, the resistor is short-circuited by the switch, while in the high speed position, the resistor is in series with the motor field.

CIRCUIT BREAKER:—Chrysler, DeSoto, Dodge, Plymouth Models—Windshield wiper is protected by a thermostatic type circuit breaker mounted on the back of the control switch. Circuit breaker begins to operate when the current reaches 12 amperes and vibrates to prevent an excessive current flow.

Studebaker Models—Circuit breaker is not used but windshield wiper is protected by a 14 ampere fuse in a connector in the feed wire between the control switch and the regular car fuse block.

ADJUSTMENT:—Park Angle—Crank arms must stop at correct parking angle to insure wiper blades being parked in correct position on windshield. See illustration for 'park angle' measurement on each model.

Car Model	Parking Angle
Chrysler, DeSoto, Dodge, Plymouth	26°
Studebaker	18°
EWE (12 volt types)	26°

To Adjust—Remove motor cover, loosen lockscrew 'E' (see illustration), turn parking switch bracket as required so that cam on crank arm opens switch contacts with crank arm in correct parking position, tighten lockscrew securely.

SERVICING:—Armature & Gear Replacement—Complete armature and gear set must be installed together if either armature or gears requires replacement. Armature shaft worm gear and crank arm gears are run-in at the factory.

Crank Gear Assembly—When installing crank arms and gears, use Crank Aligning Tool ST-298 to insure correct position of crank arms. Turn crank arms so that they point toward each other, slip aligning tool over both arms so that pivot pins at ends of arms fit into holes in fixture, hold arms in this position and assemble gears on cross-shafts. See that gears are assembled with punchmark up and that the slot in the lockplate lines up with the flats on the side of the cross-shaft and that ears on ends of lockplate fit in holes in gears.

Bearing Alignment—After motor completely assembled (but before running), strike frame several sharp blows with rawhide hammer to insure correct alignment of bearings with armature shaft.

Armature Endplay—Must be .005" minimum, .010" maximum. To adjust endplay, remove gear housing cover, expand or contract armature stop button support arms (in housing at end of armature shaft).

Motor Lubrication—No oilers provided and motor bearings do not require lubrication in service. Gear box should be filled ¾ full with special Auto-Lite ST-295 gear grease (do not use any other type) before assembly and both crank cross-shafts should be coated for entire length with this same grease before installed in housing. Use care not to get grease on motor commutator or control contacts. CAUTION—See that both crank arms are installed in correct position.

Motor Specifications

Starting (Under Load)—4.0 volts (6 volt units), 8.0 volts (12 volt units) with control switch in High Speed position.

Current Draw—Depends on motor speed (less at high speed) as follows:

	Voltage	Amperes Low Speed	Amperes High Speed
6 Volt Units	5.8 volts	4.5 max.	4.0 max.
12 Volt Units	11.6 volts	2.25 max.	2.0 max.

Field Current—2.45-2.85 amperes at 6.0 volts (6 volt units), 1.25-1.45 amperes at 12 volts (12 volt units).

Motor Speed (Full Load)—32-40 crank RPM. (Low speed), 55-60 crank RPM. (High Speed).

TESTING:—Control Switch—Use a test lamp with one lead connected to a 'hot' terminal (such as the ammeter), connect other lead as follows: With all wires disconnected from control switch, and switch turned off, connect test lamp lead to switch 'A' terminal and ground 'F' terminal. Lamp should light. Turn switch to Low Speed position, connect test lamp lead to switch 'B' terminal. Lamp should light when either 'A' or 'F' terminal grounded. Turn control switch to High Speed position, connect test lamp lead to switch 'B' terminal and ground 'A' terminal. Lamp should light.

Parking Switch—With control switch wires disconnected, connect test lamp lead to park switch lead (green wire), ground other park switch lead (black wire on Chrysler—on Studebaker, touch ground wire to other park switch terminal). Lamp should go out when parking switch contact button is pressed in and should light when button released (crank arms must not be in park position when this test made).

Motor—Connect wire from negative terminal of 6 volt test battery to black wire disconnected from control switch, ground positive terminal of battery to motor frame. Motor should operate at full speed. If motor does not run, check for open armature or field circuit, worn or stuck motor brushes, binding or jammed armature or gears (armature and gears should turn freely by hand).

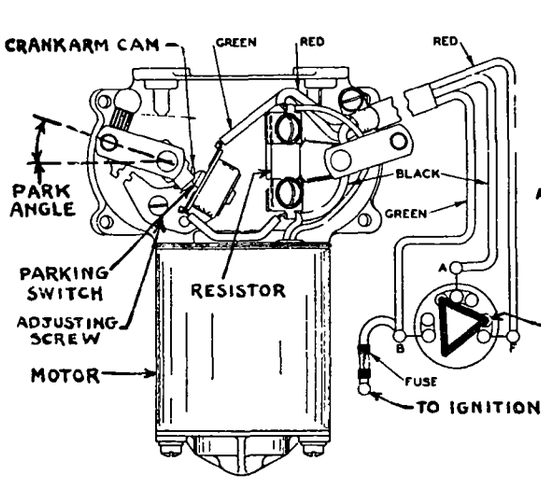
TROUBLE SHOOTING:—If wiper action not satisfactory, check as follows:

Motor Will Not Start or Run

1. **Fuse Blown (Studebaker only).** Before replacing blown fuse, check following possible causes: Check all connections, check motor ground, check all motor leads for grounds and open-circuits.

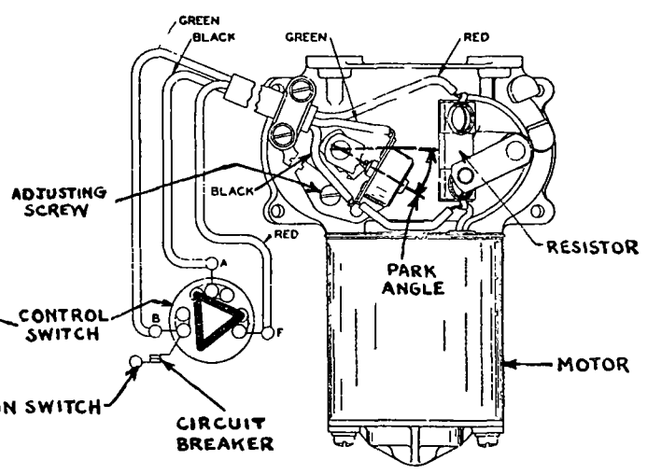
2. **Loose Connections in Wiper Circuit.** Check all wiring. Tighten connections at Windshield Wiper, Control Switch, and Ignition Switch.

3. **Crank Arm Shafts Binding.** Make certain that cross shafts greased for entire length with special ST-295 grease before installing.



4. **Linkage Binding.** Make certain that linkage between crank arm and pivot arms is not binding and that wiper blades and pivot arms operate freely.

Motor Stops with Blades in Wrong Position



1. **Park angle incorrectly set.** See adjustment section above.

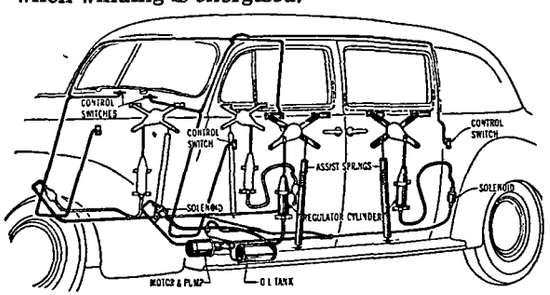
Motor Will Not Stop

1. **Parking mechanism out of adjustment.** Check Park adjustment (see Adjustment section above).

EWD-5002

OTHER 'EWD' & 'EWE' TYPES

1941 HYDRO-ELECTRIC WINDOW REGULATORS



Used On:
BUICK LIMITED SERIES 41-90 (1941)
CADILLAC, MODELS 41-67,75 (1941)
CHRYSLER, MODELS C30,C33 (1941)
LINCOLN, CUSTOM MODEL 168H (1941)
PACKARD, CUSTOM SUPER 8, 1906,7,8 ('41)

NOTE:—On some models, only the partition glass (at rear of front seat) is provided with automatic control, on other models, both front and rear door windows have automatic control with duplicate control buttons in front and rear compartments.

DESCRIPTION & OPERATION:—Windows are operated by hydraulic cylinders and assistor springs in each door which are supplied with oil under pressure by a motor driven pump from a central supply tank. Control consists of a relay and set of solenoid operated valves by which the reversible motor is turned on and oil is directed to a particlar door cylinder when the control switch button is operated. System operates as follows:

Motor & Oil Pump—Motor is similar to starter motor except that field consists of two opposed sets of two coils each. Energizing one set of field coils causes motor to rotate in one direction (supplying oil to window cylinders to raise windows), energizing opposed set of field coils causes motor to revolve in opposite direction (withdrawing oil from cylinders to lower windows). Oil reservoir consists of tank which must be kept filled with hydraulic brake fluid. Oil pump is conventional gear type and is built on one end of motor housing. A non-adjustable spring-loaded maximum pressure regulating valve is built in the pump cover with a dashpot to prevent chatter. This pressure valve by-passes the fluid when the window reaches the upper limit of its travel or when the window strikes an obstruction and prevents damage to the window and the operating mechanism.

Relay—Consists of a set of contacts controlled by a single winding and connected in the circuit so as to protect the motor when several control buttons are operated at once. Relay contacts open when winding is energized.

Control Switches & Valves—Control buttons are two-way type and when operated turn on the pump motor for desired rotation (to raise or lower window) and also actuate the solenoid valve to direct oil to particular window. Relay prevents closing switches for both up and down operation at one time and is designed to give control to down operation (if up and down switches closed simultaneously, both windows will move down).

Window Operating Cylinders—Consist of a long hydraulic cylinder and assistor spring in each door which are linked to the window operating mechanism. When window is raised, oil is pumped into cylinder and remains trapped in cylinder to hold window closed. To lower window, motor driven pump is reversed to withdraw oil from cylinder (solenoid valve opens to permit oil to flow out). The piston in the window operating cylinder is connected to the piston rod through a calibrated compression spring which prevents pressure building up in system due to heat expansion of the fluid in the cylinders and the lines with the windows closed.

SERVICING:—Supply Tank Oil Level—Check level with all windows down (some fluid will be trapped in cylinders and oil level goes down when windows closed). Tank will overflow if filled when windows or partition glass are raised. Use only genuine brake fluid to fill the window regulator system.

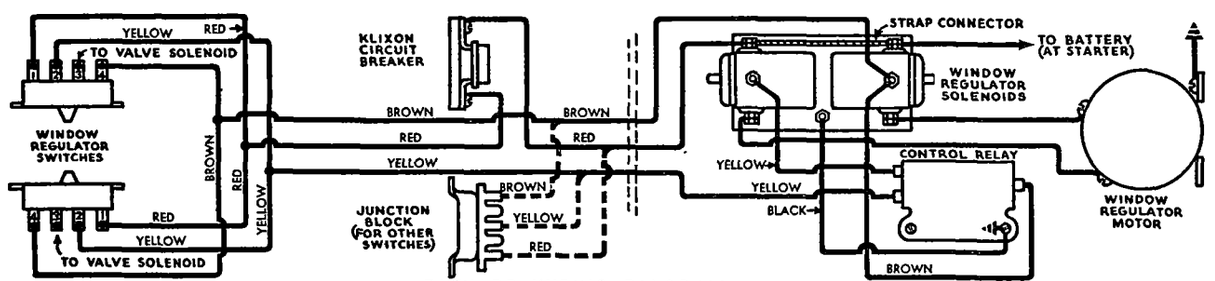
CAUTION—Mineral oil will ruin rubber parts in system and require replacement of all rubber parts.

Motor & Oil Pump—Requires no attention other than oiling of armature end bearing at 3000 mile intervals. Pump should deliver pressure of 120-130 lbs. (in one direction) and vacuum of 15-18" (in opposite direction). Check only with combination pressure-vacuum gauge. When overhauling pump, use care not to interchange end thrust plates (these plates and gears ground to close-fit and will not operate satisfactorily if interchanged). Remove all traces of old gasket and use only correct type new gasket when reassembling pump. CAUTION—Reuse of old gaskets or installation of gaskets of incorrect thickness will cause leakage, binding of pump gears, or loss of pressure.

Relay—Auto-Lite Model HRD-4001 Relay specifications are as follows:

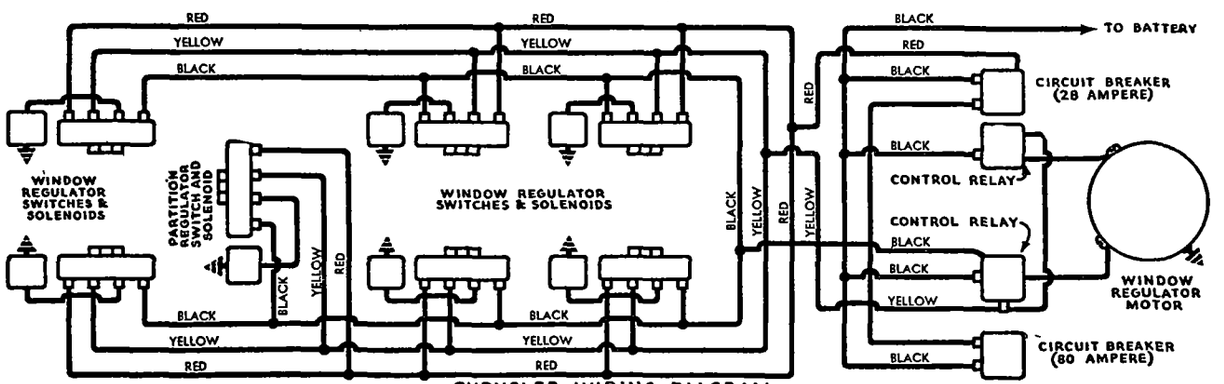
Contacts Open—3.5-4.5 volts. Adjusted by bending lower spring hanger to increase or decrease armature spring tension.

Contacts Close—1.0-1.8 volts below opening voltage (after voltage has been increased to 6 volts). Adjusted by turning brass cam on contact side of yoke (apply drop of air-drying varnish to cam after completing adjustment).



Contact Gap—.005" minimum.

Air Gap—.044-.046". Measure at center of core with contacts closed. Adjust by raising or lowering stationary (upper) contacts.



Window Cylinders—When disassembling cylinder, use care not to damage piston rod boot. Use only correct type replacement piston spring (piston rod connection) and piston sealing ring. Power cylinder will not operate satisfactorily if other parts installed. Pour one ounce of brake fluid into cylinder above piston when reassembling (necessary to lubricate upper end of piston).

Window Glass Replacement—When replacing window, attach regulator arm to lower glass channel without connecting piston rod. Move window up and down by hand to make certain that it moves freely without binding. Adjust piston rod length so that window is supported by piston resting on bottom of cylinder when fully lowered. To make this adjustment, loosen locknut and turn piston rod in or out of connector rod as required. Use great care not to damage rubber boot or allow dirt to drop into cylinder while adjusting, tighten locknut and make certain that washer and hairpin lock are in place to prevent connector rod being disconnected from regulator arms in service. Assistor spring tension should not be changed and spring should be serviced by replacement.

Control Valves, Switches, & Lines—Valves and switches should be serviced by replacement. When connecting lines at solenoid valves, motor or cylinders, hold connection with wrench while tightening line to prevent damage. Solenoid valves are grounded through mounting clamp and clean, tight connections must be made at this point.

PACKARD WIRING DIAGRAM

CHRYSLER WIRING DIAGRAM

BENDIX HYDRAULIC, SINGLE ANCHOR (WITHOUT ECCENTRIC ADJUSTMENT)

Used On:

BUICK, SERIES 41-40, 50, 60, 70, 90 (1941)
CADILLAC V8, 41-60S, 61, 62, 63, 67, 75 (1941)
HUDSON SIX, MODELS 10, 11, 12, 18 (1941)
HUDSON EIGHT, MODELS 14, 15, 17 (1941)
LINCOLN, ZEPHYR & CONTINENTAL 16H (1941)
LINCOLN, CUSTOM MODEL 168H (1941)
NASH SIX, AMBASS. MODEL 4160 (1941)
NASH EIGHT, AMBASS. MODEL 4180 (1941)
OLDSMOBILE SIX, 66, 76, 96 (1941)
OLDSMOBILE EIGHT, 68, 78, 98 (1941)
PACKARD CLIPPER, MODEL 1951 (1941)
PACKARD SIX, '110' MODEL 1900 (1941)
PACKARD EIGHT, '120' MODEL 1901 (1941)
PACKARD SUPER 8, '160' 1903, '180' 1906 (1941)
PONTIAC SIX, 41-24, 25, 26 (1941)
PONTIAC EIGHT, 41-27, 28, 29 (1941)
WILLYS AMERICAR, Model 440 ('41)—SEE NOTE

These brakes same design as used on corresponding 1940 car models (except Hudson—not used previously).

NOTE:—Packard Super Eight (Other Models)—Models 1904, 5 Super Eight and 1907, 8 Custom Super Eight have Bendix Hydraulic Brakes with Eccentric Adjustment. See separate article for adjustment directions on this type.

Willys Americar—Brake shoes on this model are Lockheed Double Anchor type. See Lockheed Double Anchor Brake article for adjustment directions on this type.

SPECIAL SERVICE NOTES:—Hudson Pedal Connection—For less sensitive brakes with harder pedal action, particularly at low speeds, brake pedal link may be changed to right hand hole in master cylinder operating lever. On all production cars, link is regularly assembled in left hand hole for soft pedal action.

Oldsmobile Wheel Cylinder Stops—Stops are formed on backing plate which prevent pistons being forced out of wheel cylinder for any reason. These stops make it unnecessary to use piston clamps to retain pistons when brake drums and shoes are removed but wheel cylinder must be removed from backing plate before it can be dismantled or pistons taken out.

Pontiac Wheel Cylinder Piston Stops—Stops are provided on backing plate which prevent pistons being forced out of cylinder when drums or shoes removed. These stops make it unnecessary to use piston clamps to retain pistons when drums and shoes removed but wheel cylinder must be removed from backing plate before it can be dismantled or pistons taken out.

DESCRIPTION:—These brakes same design as used on 1940 cars and are similar to other Bendix single-anchor brakes except that the eccentric adjustment is omitted and all adjustments are made at the adjusting screw and the anchor pin as given below.

ADJUSTMENT:—Before making adjustments, jack up all four wheels, loosen or disconnect parking brake cables at intermediate lever or equalizer bar, remove adjusting hole screw covers on backing plate (see Pontiac Note below), check brake pedal clearance (See Brake Pedal Adjustment below), adjust brakes at each wheel as follows. CAUTION—If hand brake cables not disconnected, shoes may be held 'on' by cables (if adjusted too tight) so that correct brake adjustment cannot be secured.

Pontiac Adjusting Hole Covers—Covers are rubber and have lip on inner edge to engage slot in backing plate. To remove, insert screwdriver under lip of cover and pry out. To install, moisten cover with water or brake fluid, start one end in adjusting hole slot, strike cover with hammer to seat it in slot.

Minor Adjustment—For Wear (Except Cadillac & Packard):—At each wheel, make certain that the anchor pins are tightened (check with 16" wrench, if anchor pins loose, adjust as directed under Major Adjustment below). Insert special tool or screwdriver through adjusting hole in backing plate, turn notched adjusting screw by moving tool handle up toward center of wheel until brake drum can just be turned by hand. Adjust and connect hand brake cables (see Parking Brake Adjustment below), then back off adjusting screw 17 notches or 'clicks' (Buick), 14 notches (Hudson, Lincoln, Nash Pontiac), 20 notches (others) until shoes are just free and drum revolves without any drag. If brakes are not free after making this adjustment, or if shoes drag at anchor pin end, adjust anchor pin as directed under Major Adjustment below.

Hudson Note. Check mechanical 'follow-up' setting after adjusting brakes (see separate article following).

Parking Brake Adjustment—Before connecting hand brake cables, adjust cable lengths on each model as follows:

Buick. With rear wheel brake shoes expanded so that drums can just be turned, tighten adjuster nut on rear end of hand lever cable (at wheel cable equalizer on torque tube near rear axle) until cables are taut with hand lever in released position, back off adjusting screw in each wheel 15 notches so that wheels free of any brake drag, check equalization by applying brakes with hand lever until drums can just be turned. Equalize wheels by backing off adjusting screw in tight wheel not more than 2 notches (if this does not equalize wheels, check centering of wheel cables in equalizer).

Hudson—With rear brake shoes expanded tightly against drum, pull hand lever 'on' two notches so that clearance between hand brake cable lever and end of slot in guide plate is ⅛", pull cables tight, adjust clevis at forward end of each cable so that clevis pins just enter holes in toggle on lever, connect cables, back off adjusting screw in each wheel until wheels are free, check equalization.

Lincoln Models. Do not expand rear wheel brake shoes. Pull hand lever 'on' one notch, apply brakes by depressing brake pedal with 30 lbs. pressure (use pedal jack, hold pedal in this position while adjusting). Remove slack in cable by adjusting conduit clamp. Release hand lever and brake pedal, see that brakes are free.

Nash. With rear brake shoes expanded tightly against drum, pull hand lever 'on' 2 notches, loosen two bolts on adjusting clamp (connecting lever and wheel cables), pull cables tight and tighten bolts. Return lever to 'off' position. Back off adjusting screw in each wheel to free brakes and check equalization. See that hand brake lever on each wheel backing plate has ⅛" free travel with hand lever in off position. Equalize hand brakes by loosening rear bolt in cable adjusting clamp and applying hand brakes (this will allow cable to shift on adjusting clamp). Check position of hand brake cable guide on rear spring. Guide should be exactly 17½" to rear of spring front eye bolt center-line.

Oldsmobile. With rear wheel brake shoes expanded so that drums can just be turned, pull wheel cables forward to eliminate all slack, adjust clevises on forward ends of cables so that clevis pins can just be inserted with equalizer link held parallel to propeller shaft, connect cables (insert clevis pins with head toward top), back off adjusting screw in each wheel approximately 20 notches until wheels are free, check equalization.

Pontiac. Check hand brake cable tension by moving clevis pin at cross lever wheel cable spreader, pin should move up and down with thumb and finger pressure (hand lever in released position, rear wheel brake shoes not expanded), and both rear wheels should lock with hand lever in third notch. To adjust, remove cross lever clevis pin and engage pin in another of the several holes in the cable spreader (approximate setting), remove hand lever clevis pin and turn clevis on cable (exact setting) using extreme care not to twist the cable. To equalize wheel cables after adjusting, loosen clampscrews on wheel cable spreader at cross lever (if necessary pry clamp ears apart with a screwdriver so that cable free in spreader), apply brakes hard by pulling back on hand lever, tighten spreader clampscrews before releasing hand lever.

Minor Adjustment—For Wear (Cadillac & Packard Models):—Manufacturer recommends that adjusting screw and anchor pin be adjusted to secure .015" clearance at each end of Secondary Shoe as directed in 'Major Adjustment' below (wheels must be removed for this adjustment). Then adjust Parking Brake as follows:

Cadillac Models. With brakes released (shoes not expanded in drums), loosen nut on rear end of hand lever cable rod at wheel cable sheave. Expand rear wheel brake shoes by turning adjusting screw at each wheel until drums can just be turned by hand. See that hand lever in fully released position, tighten nut at rear wheel cable sheave (locknut must be backed off to permit this adjustment) until cables are taut, tighten locknut. Back off adjusting screw in each wheel 15-20 notches so that wheels are free.

Packard Models. With rear brake shoes expanded so that drums can just be turned by hand, pull hand lever on to first notch, pull each rear wheel cable forward with 20 lbs. pull to take up all slack and lost motion, adjust clevis on forward end of each cable so that clevis pin can just be inserted in equalizer link with link centered, connect cables. Back off adjusting screw in each rear wheel until drums turn freely without drag, check equalization. Equalize by backing off adjusting screw in tight wheel slightly.

Major Adjustment (For New Shoes, Relined Brakes or when Minor Adjustment not satisfactory):—Jack up all four wheels, loosen or disconnect parking brake cables at equalizer or intermedate lever, remove adjusting screw hole cover on backing plate and inspection hole cover on drums (remove wheels for access). Check pedal clearance (see Brake Pedal Adjustment below). Adjust each wheel brake as follows. CAUTION—If hand brake cables not disconnected or loosened, shoes may be held on by cables (if adjusted too tight) so that correct brake adjustment cannot be secured.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Anchor Pin & Adjusting Screw Adjustment—Turn drum so that inspection hole is at center of secondary shoe (rear shoe on each wheel), insert screwdriver and pry secondary shoe away from drum so that primary shoe (other shoe) is seated solidly against drum. Insert screwdriver or special adjusting tool in hole on backing plate and turn notched adjusting screw by moving handle of tool up toward center of wheel until .015" feeler is snug between lining and drum at adjusting screw end of secondary (rear) shoe. Check clearance at anchor pin (opposite) end of this same shoe. If clearance not .015", adjust anchor pin by loosening locknut and tapping anchor out toward drum (slotted hole type with plain end) or turn anchor pin in direction of forward wheel rotation (eccentric type with slotted end) until .015" clearance secured, hold anchor pin from shifting and tighten locknut securely with 16" wrench. Recheck clearance at adjusting screw end of shoe. Make any necessary readjustments at adjusting screw and anchor pin to secure clearance of .015" at both ends. It is very important that primary shoe be out in solid contact with drum while this adjustment being made. Adjust hand brake cables as directed in Parking Brake Adjustment under Minor Adjustment above.
CAUTION—When checking clearance with feeler gauges, gauge should be inserted approximately 1½" from end of shoe lining.

Brake Pedal Adjustment:—On all models, brake pedal must be checked and adjusted to insure master cylinder piston being back against its stop in the master cylinder for correct compensating action with brakes released. To adjust, loosen locknut on piston connector rod, turn clevis or rod to secure clearances specified below with master cylinder piston against the stop.

Buick—Clearance between pedal and underside of toeboard should be 1" on all models.

Cadillac—The rubber grommet on the pedal under toeboard should be compressed to overall length of ¾" with brakes released.

Hudson Models—Clearance between pedal shank and underside of toeboard should be ¼" with brakes released. To adjust, remove clevis pin at forward end of connecting link (between pedal and master cylinder bellcrank), loosen locknut and turn link.

Lincoln—Brake pedal should have ¼-½" free movement or play (measured at pedal pad) in released position.

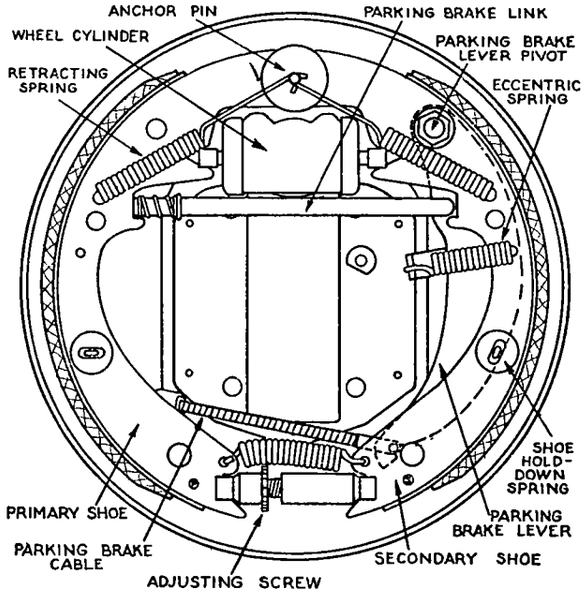
Nash—Brake pedal should have ¼-½" free movement or play in released position.

Oldsmobile—Sponge rubber pedal seal on underside of toeboard should be compressed not more than 3/16" with brakes released.

Packard—Brake pedal should have ¼-½" free movement or play in released position.

Pontiac—Pedal height should be adjusted so that brake pedal is even with clutch pedal. Distance from floor mat to pedal pad should be 4 3/16" (Deluxe Torpedo 6 & 8 41-25, 41-27), 5 3/16" on all other models (41-24, 26, 28, 29).

SERVICING:—For instructions on all service operations (Bleeding of brake lines, Brake shoe removal and installation, Master Cylinder & Wheel Cylinder disassembly and overhaul, Lubrication of brake cables) ***refer to 'Bendix Hydraulic Type, Single Anchor, Rigid cylinder' brake article or 'Hydraulic Brake Servicing' article in Mechanical Equipment Section of manual for complete data.***



BENDIX HYDRAULIC, SINGLE ANCHOR (WITH ECCENTRIC ADJUSTMENT)

Used On:

PACKARD SUPER 8, '160' 1904, 5 (1941)
PACKARD CUSTOM SUPER 8, '180' 1907, 8 (1941)
PACKARD COMMERCIAL, 1901A, 1903A (1941)
These Brakes same design as used on corresponding 1940 Packard models.

NOTE:—Packard (Other Models)—These other models with Bendix Hydraulic Brakes do not have Eccentric Adjustment and are adjusted differently. See separate article for adjustment directions on type without Eccentric.

ADJUSTMENT:—Before making adjustments, jack up all four wheels, loosen or disconnect parking brake (hand lever) cables at intermediate lever, remove adjusting screw hole covers on backing plates and feeler gauge hole cover on drum (remove wheels for access). Check brake pedal clearance (see Brake Pedal Adjustment below), then adjust at each wheel as follows. CAUTION—If hand brake cables not disconnected, shoes may be held 'on' by cables (if adjusted too tight) so that correct brake adjustment cannot be secured.

Minor Adjustment (For Wear):—Adjust at each wheel as follows:

1. **(All Models).** Loosen eccentric locknut, turn eccentric in direction of forward wheel rotation until .010" feeler is snug between lining and drum at each end of this secondary shoe, hold eccentric from turning, tighten locknut. Clearance at both ends of shoe should be alike (slightly less at anchor pin end). If clearance at anchor pin end not correct, anchor pin must be re-located (see Major Adjustment below). NOTE—When using feeler gauge to check clearance, gauge should be inserted at point approximately 1½" from end of shoe lining.

2. **(All Models).** Insert special tool, or screwdriver, in adjusting screw hole on backing plate, turn adjusting screw by moving outer end of tool up toward center of wheel to expand shoes until wheel can just be turned (if necessary to turn adjusting screw more than 50 notches or clicks, examine linings for wear and replace if necessary). Adjust and connect hand lever cables (see Hand Brake Adjustment below). Then back off adjusting screw until wheel is just free of drag (approximately 20 notches). Check equalization by depressing brake pedal (use pedal jack) until wheel with least drag can just be turned by hand, equalize by backing off adjusting screws on tight wheels not more than 2-3 notches. Do not tighten loose wheels.

3. **Hand Brake Adjustment (All Models).** Adjust hand brake cables for each model as follows:

Packard Models. With rear brake shoes expanded so that drums can just be turned by hand, pull hand lever on to first notch, pull each rear wheel cable forward with 20 lbs. pull to take up all slack and lost motion, adjust clevis on forward end of each cable so that clevis pin can just be inserted in equalizer link with link centered, connect cables. Back off adjusting screw in each rear wheel until drums turn freely without drag, check equalization. Equalize by backing off adjusting screw in tight wheel slightly.

4. **Brake Pedal Adjustment.** Brake pedal must have ¼-½" free travel or play in the released position to insure master cylinder piston being back against its stop for correct compensating action with brakes released. To adjust, loosen locknut on piston rod, turn rod or clevis making certain that piston is against the stop.

Major Adjustment (For New Shoes or Relined Brakes):—If shoes with new linings being installed, adjusting screw and eccentric adjustment must be backed off to allow drums to be installed. Disconnect parking brake cables, remove adjusting screw cover on backing plate and inspection hole cover on drums. Adjust brakes at each wheel as follows:

1. **Anchor Pin & Eccentric Adjustment (All Models).** Loosen eccentric locknut, turn eccentric in direction of forward wheel rotation until .010" feeler is just snug at adjusting screw end of this secondary shoe, hold eccentric from turning and tighten locknut. Check clearance at anchor pin end (opposite end) of this same shoe. If clearance not .010", adjust anchor pin as follows: Loosen anchor pin locknut one turn, turn anchor pin in direction of forward wheel rotation until the clearance at anchor pin end of shoe is exactly .010", hold anchor pin from moving and tighten locknut securely with 16" wrench. Recheck clearance at adjusting screw end of shoe. Make any necessary readjustments at eccentric and anchor pin until .010" clearance secured at both ends of this shoe. Then proceed with adjustments (2), (3), and (4) as given under Minor (Wear) adjustment above.

SERVICING:—All servicing operations including Bleeding of Lines, Brake Shoe Removal & Installation, Master Cylinder and Wheel Cylinder Overhaul are same as previous models. ***See 'Bendix Hydraulic Type, Single Anchor, Rigid Cylinder' brake article or 'Hydraulic Brake Servicing' article in Mechanical Equipment Section of manual for complete data.***

HAWLEY TYPE

Used On:

CROSLEY, MODEL CB-41 (1941)

TYPE:—Hawley Neutral Shoe type with floating brake lining. Lining consists of a single piece of sufficient length to reach entirely around shoes with gap of 1/16" at ends. Lining is centered on shoes by rib on backing plate and conical retainer on wheel side.

DESCRIPTION & OPERATION:—Wheel Brakes. Two shoes per wheel, anchored at adjusting screw end and operated by cam at opposite end. Shoes are held against adjusting screw and cam by small coiled spring hooked between shoes at each end.

Linkage:—Wheel brakes operated by cables from main cross-shaft on frame. Cables enclosed in conduits at wheel ends and provided with adjusting clevises at cross-shaft.

Hand Brake:—Hand lever is linked to main cross-shaft on frame. Cables enclosed in conduits at wheel ends and provided with adjusting clevises at cross-shaft.

Hand Brake:—Hand lever is linked to main cross-shaft and applies all four wheel service brakes.

ADJUSTMENT:—Jack up all four wheels, remove clevis pins and disconnect all four wheel cables at cross-shaft. At each wheel, loosen locknut and tighten brake adjusting screw on backing plate (turn screw counter-clockwise) until slight drag noticed when wheel turned by hand, then back adjusting screw off (turn screw clockwise) until wheel is just free, tighten locknut.

Linkage Adjustment—Depress brake pedal 1" and hold in this position. Adjust clevis on cross-shaft end of each wheel cable so that brakes barely drag when cable connected to cross-shaft. Release pedal. Road test car and equalize brakes by turning adjusting screw on tight wheel slightly (turn screw clockwise to loosen brakes).

SERVICING:—Brake Lining Replacement—To remove and renew brake linings, jack up wheel, remove hub cap, wheel, and hub assembly. Remove conical brake lining retainer. Take out old lining. Insert new lining and re-install wheel.

Brake Lining Note—Use only genuine Crosley lining—furnished in correct length to fit around shoe with 1/16" gap at ends. Lining is not riveted on shoes and is installed loosely in drum.

Brake Cable Lubrication:—Whenever brake cables adjusted, fill cable conduits with grease. When connecting cables use care not to twist or buckle cables excessively.

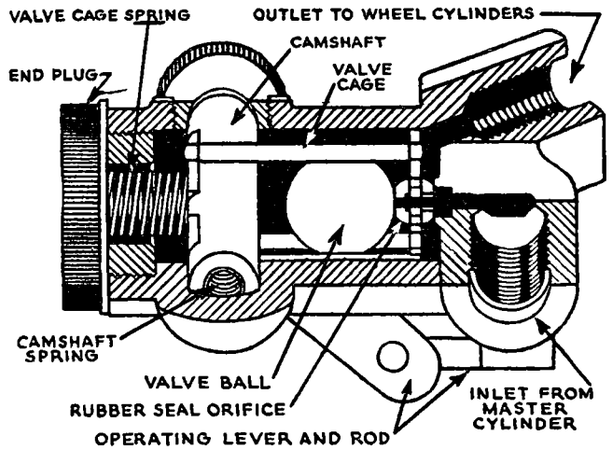
HUDSON MECHANICAL FOLLOW-UP

Used On:

ALL SIX & EIGHT CYLINDER MODELS (1941)

DESCRIPTION:—Same design as used on previous models. Consists of linkage connecting brake pedal and hand brake cable lever so that rear wheel brakes applied mechanically by brake pedal with additional pedal travel (beyond point where brakes applied by hydraulic system).

ADJUSTMENT:—See that brake pedal properly adjusted and that hand brake cable lever is against its stop (end of slot in guide plate). Loosen locknut on brake pedal pushrod (linking pedal and idler lever), turn rod until distance from rear face of lug on rod to forward end of pushrod tube is exactly 1¼", tighten locknut.



HILL-HOLDER & NOROL

Optl. Equipment On:

CAR MODELS WITH HYDRAULIC BRAKES (1941)

These units same design as used on 1940 car models.

DESCRIPTION:—Same design as units used on previous car models. Both units consist of a gravity and clutch pedal controlled check valve in the hydraulic brake line so that brakes are held 'on' with car heading uphill on grade and clutch disengaged. Brakes are released through clutch pedal connection when clutch is engaged.

ADJUSTMENT:—Adjust whenever clutch pedal adjusted or when linkage disconnected. Mounting of unit should be checked whenever unit removed or disturbed in any manner.

Adjustment:—Check adjustment by operating car and noting point at which brakes release (brakes should release just before clutch engages). To adjust, loosen locknut on operating rod (linking unit and clutch pedal), turn adjustment so as to shorten rod for earlier release, lengthen rod for later release, tighten locknut after adjusting and check operation.

Mounting:—Unit must be level (crosswise and lengthwise of car) when installed for correct operation. To check mounting, use spirit level placed on bosses on top of housing with car standing on level floor and all tires inflated to correct pressure. Adjust by loosening mounting bolts and shifting entire unit slightly (this adjustment not provided on all models).

LOCKHEED HYDRAULIC SINGLE ANCHOR TYPE

Used On:

STUDEBAKER CHAMPION, MODEL 3G (1941)

This Brake same design as used on 1940 Champion.

ADJUSTMENT:—Before making adjustments, jack up all four wheels, check pedal clearance or free travel (see Brake Pedal Adjustment below), release hand brake. Then adjust brakes at each wheel as follows:

Minor Adjustment (For Wear):—Install wrench on eccentric adjusting cam on backing plate with wrench handle up, turn cam by moving wrench handle out toward wheel until shoe contacts drum (brakes drag when wheel revolved), then turn cam in opposite direction until wheel is just free of any brake drag. Adjust all eccentric cams in this manner (one cam for each shoe, two cams on each backing plate). Cams are held in position by spring tension and no locking nuts are used.

Major Adjustment (For new linings, etc):—With wheels removed, rotate brake drums so that inspection hole in drum is at heel (anchor pin end) of shoe, loosen eccentric anchor pin locknut, turn anchor pin until clearance between lining and drum is exactly .005" (measured with feeler gauge 1½" from end of lining). Check to see that heel clearance on opposite shoe is likewise .005", tighten anchor pin locknut. Turn drum so that slot is 1½" from end of lining at toe end of shoe, adjust eccentric cam (as directed under Minor Adjustment above) so that clearance is exactly .010". Recheck clearance at anchor pin end and make any necessary re-adjustments to secure correct clearance at both ends of shoe. Adjust eccentric cam on opposite shoe, then repeat adjustment at other wheels.

Brake Pedal Adjustment:—Pedal must have ¼" min., ⅜" max. free travel to insure master cylinder piston being back against its stop (in cylinder) for correct compensating action when brakes released. To adjust, loosen locknut and turn large adjusting nut on master cylinder end of connector rod.

Parking Brake Adjustment:—Adjust whenever brakes adjusted for wear or new shoes installed. To adjust, place the hand lever in second notch 'on' position, remove pin linking brake cable to parking brake lever on rear wheel backing plate, pull on cable to eliminate slack and press forward on lever to take up play, install pin through holes in lever and cable end which line up with slight drag noticeable at wheel. Adjust both wheels in same manner, then release hand lever and check to see that both wheels free from any drag.

SERVICING:—All service operations including Bleeding of Lines, Master Cylinder and Wheel Cylinder Overhaul are same as for other Lockheed Brakes. ***See Lockheed Hydraulic Type brake article in Mechanical Equipment Section of manual for complete data.***

LOCKHEED HYDRAULIC DOUBLE ANCHOR TYPE

Used On:

CHRYSLER 6, C28 ROYAL & WINDSOR (1941)
CHRYSLER 8, C30 SARATOGA & NEW YORKER (1941)
CHRYSLER 8, C33 CROWN IMPERIAL (1941)
DE SOTO, S8 CUSTOM & DELUXE (1941)
DODGE, D19 DELUXE & CUSTOM (1941)
GRAHAM HOLLYWOOD, MODELS 109, 113 (1941)
NASH SIX, '600' MODEL 4140 (1941)
PLYMOUTH, P11 & P12 MODELS (1941)
STUDEBAKER COMMANDER, MODEL 11A (1941)
STUDEBAKER PRESIDENT, MODEL 7C (1941)
WILLYS AMERICAR, MODEL 441 (1941)
WILLYS COMMERCIAL MODELS 441, 441P (1941)

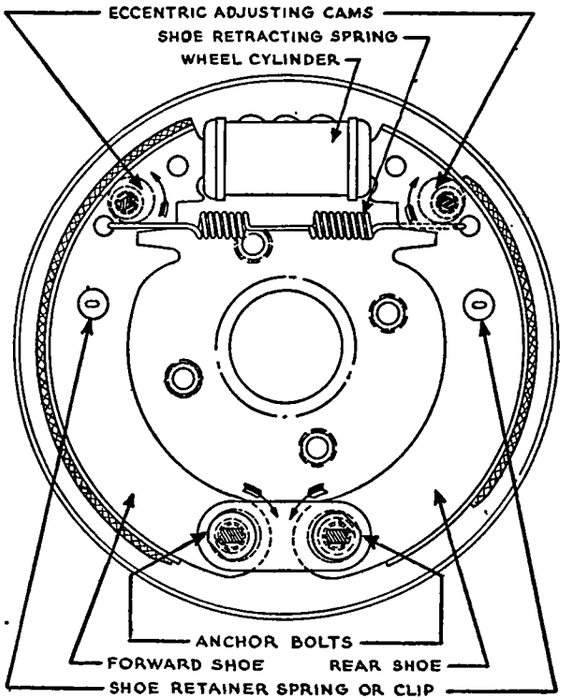
These Brakes same design as used on corresponding 1940 car models.

NOTE:—**Chrysler C30, C33**—Rear brakes only are Double Anchor type. Front wheel brakes are Two-Cylinder type (see separate article for data on Two-Cylinder brakes). Rear brake design changed from type used on 1940 cars by addition of piston cup spring in wheel cylinder (no spring used on 1940 cars).

Willys Americar—These brakes are Bendix type but have Lockheed type brake shoes which are adjusted as directed below.

Willys Commercial Models — Hydraulic brakes (same as Passenger Car) now used on these models. Mechanical brakes used on 1940 models have been discontinued.

SPECIAL SERVICE NOTES:—**Chrysler C30, C33 Wheel Cylinders**—Wheel cylinder pistons have rubber 'piston ring' installed in groove in each piston. Separate piston cups are not used but a piston spring has been added on 1941 cars.



Chrysler, DeSoto, Dodge, Plymouth Brake Anchor Pins—Marked by arrow on inner end to indicate point of minimum adjustment (same as for 1940). See special anchor pin adjustment directions given under Major Adjustment below.

ADJUSTMENT:—Before making adjustments, jack up all four wheels, check brake pedal clearance or free travel (See Brake Pedal Adjustment below), check pedal travel (Chrysler—see below), release hand brake and make certain that rear wheels are free. Then adjust at each wheel (see following article for adjustment of Two-Cylinder type used on Chrysler C30, C33 front wheels) as follows:

Chrysler, DeSoto, Dodge, Plymouth Note—Total pedal travel on these models should be 1¾-2" (includes free play of ⅛-¼" and ⅝-¾" additional travel before master cylinder primary cup closes off relief port and begins to apply brakes). If Minor Adjustment does not give correct pedal travel, or if relief port is cut off with less than ¾" pedal travel, brake pedal adjustment (free play) should be checked.

Minor Adjustment (For Wear):—On Willys only, loosen eccentric cam locknut, on all models turn eccentric cam adjustment on backing plate out until brake shoe contacts drum solidly (install wrench on cam adjuster with handle up, move wrench handle toward rim of wheel), then back eccentric cam off until wheel is just free of any drag, tighten locknut (Willys only). Adjust all eccentric cams in this manner (one cam for each shoe, two cam adjusters on each wheel backing plate. On all models except Willys, cams are held in position by spring tension and no locking nuts are used.

Major Adjustment (For New Linings, etc.):—On Willys model slot provided in brake drum so that feelers can be inserted to check shoe clearance. On all other models special adjusting fixture or gauge (or cutaway drum) must be used to check setting. With gauge installed in place of brake drum and turned so that gauging is at heel (anchor pin end) of shoe approximately 1½" back from end of lining (do not gauge relieved or chamfered end of lining), loosen anchor pin locknut on backing plate, turn

anchor pin (see special directions for Chrysler, De Soto, Dodge, Plymouth models below) until clearance between lining and drum is correct (see table below), tighten anchor pin locknut. Turn gauge to toe (wheel cylinder end) of shoe, adjust eccentric cam as directed in Minor Adjustment above until clearance is correct (see table below). Adjust each shoe in all wheels in same manner. Check Parking Brake Adjustment as directed below.

Brake Shoe Clearances

Car Model	Heel (Anchor End)	Toe (Cyl. End)
Chrysler 6	.006"	.012"
Chrysler 8 (Front Shoe)	.006"	.007"
Chrysler 8 (Rear Shoe)	.007"	.007"
DeSoto, Dodge	.006"	.012"
Graham	.006"	.010"
Nash	.004"	.008"
Plymouth	.006"	.012"
Studebaker	.005"	.010"
Willys	.005"	.008"

Chrysler, De Soto, Dodge, Plymouth Note—Inner ends of anchor pins are marked by an arrow and flattened so that adjusting wrench can be applied at this end of pins. Before making adjustment, loosen anchor pin bolt nuts on backing plates, turn each anchor pin so that arrows line up with arrow heads together. Then adjust anchor pins by turning right hand pin counter-clockwise, left hand pin clockwise (pins turned toward each other at top) to secure correct clearance. CAUTION—Shoes will not be centralized in drum (even though set for correct clearance) unless anchor pin arrows lined up first and adjustment made exactly as specified above.

Brake Pedal Adjustment:—Brake pedal must have sufficient free travel or play to insure master cylinder piston being back against its stop with brakes released so as to provide correct compensating action. To adjust, loosen locknut on master cylinder end of pedal rod, turn large adjusting nut until pedal free travel is ⅛-¼" (Chrysler, DeSoto, Dodge, Plymouth), ¼-½" (Nash), ¼-⅜" (Studebaker), ½" (Others), tighten locknut.

Chrysler C33 Note—See Bendix Vacuum Power Cylinder article for master cylinder pushrod adjustment (power cylinder adjustment will be disturbed unless adjustments made exactly as directed).

Parking Brake Adjustment:—Adjust hand brake cables on models where hand lever applies rear wheel service brakes as follows (On Chrysler, De Soto, Dodge and Plymouth models, an independent hand brake located on propeller shaft at rear of transmission. See car model 'M' page for adjustment).

Graham—With hand lever in released position, remove any slack between hand lever and intermediate lever by adjusting turnbuckle at rear end of hand lever cable. Then pull hand lever on to second notch, adjust each wheel cable by turning adjusting clevis at forward end of cable until slight drag felt at rear wheels, connect cables and release hand lever. Wheels should be free of any drag.

Nash—Set hand lever two notches 'on', loosen locknuts on wheel cable spreader (hand lever cable connection), remove all slack from cables by pulling forward on wheel cables and to rear on hand lever cable, tighten locknuts. Release hand lever and check to see that rear wheels are free of any drag.

Studebaker—Set hand lever two notches 'on'. Loosen locknuts and turn turnbuckle on hand lever cable (below and to left of transmission) until slight drag noticeable at both rear wheels when wheels turned by hand. Tighten turnbuckle locknuts. Release hand lever and check to see that both rear wheels free from any drag.

Willys—Set hand lever two notches 'on'. Loosen locknuts on hand lever cable connection at wheel cable spreader (equalizer), take up cable slack by turning up rear nut until slight drag noticeable at rear wheels, tighten locknuts. Release hand lever and check to see that rear wheels free from any drag.

SERVICING:—For instructions on all service operations (Bleeding of brake lines, Brake Shoe removal and installation, Master Cylinder and Wheel Cylinder disassembly and overhaul, Lubrication of brake cables), ***refer to 'Lockheed Double Anchor Type' brake article or 'Hydraulic Brake Servicing' article in Mechanical Equipment Section of manual for complete data.***

LOCKHEED HYDRAULIC TWO-CYLINDER TYPE

Used On:

CHRYSLER 8, C30, 33 ('41) FRONT WHEELS ONLY.

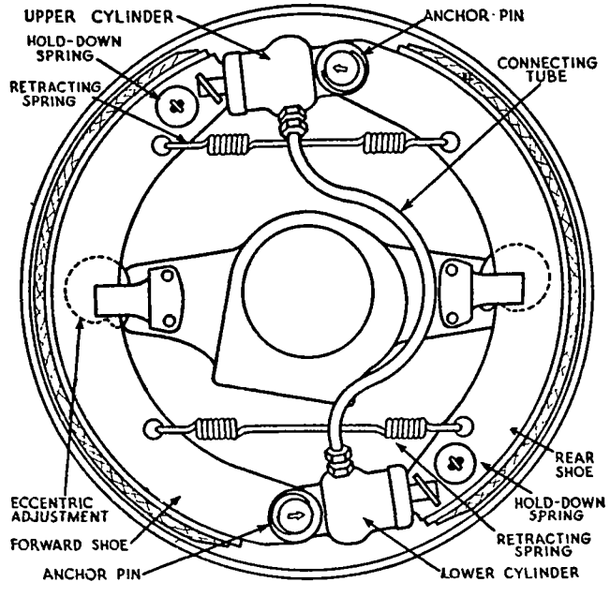
This Brake same design as used on 1940 Chrysler Eight Front Wheels except as noted below.

NOTE:—These brakes used on front wheels only. Rear brakes are conventional Lockheed Double Anchor Type with single double-acting wheel cylinder (see preceding article for rear brake data).

1941 Changes—Piston spring now used in each wheel cylinder behind piston (no springs used on 1940 cars).

Chrysler C33 Power Brake—This model has Bendix Vacuum Power Cylinder (internal valve type). See separate article for adjustment and servicing data.

DESCRIPTION:—Each brake shoe actuated by individual wheel cylinder with single acting piston (forward shoe anchored at lower end and operated by upper cylinder, rear shoe anchored at upper end and operated by lower cylinder) the effect being similar to that of two 'forward' shoes on other Lockheed brakes. Brake cylinders are connected in tandem with a connecting tube extending from one cylinder to the other within the brake drum (brake line is connected to upper cylinder in usual manner), the principal difference being an additional bleeder connection on the backing plate at the lower cylinder. Double retracting springs are used (hooked between shoes at each end).



CAUTION—When bleeding brake lines, **both** wheel cylinders must be bled—see directions below.

ADJUSTMENT:—Before making adjustments, jack up all wheels, check brake pedal free travel (should ⅛-¼" (to take up pushrod play) plus additional ⅝-¾" (to close off master cylinder relief port) before brakes begin to be applied. Total pedal travel to apply brakes should be 1¾-2". If Minor Adjustment does not give correct pedal travel, or if relief port is cut off with less than ¾" pedal travel, check brake pedal free play adjustment.

Minor Adjustment (For Wear):—Turn eccentric cam adjuster on backing plate out until shoe is solid against drum and wheel is locked, then back eccentric off until wheel is free. Adjust each eccentric in this manner (one eccentric for each shoe, two on each wheel backing plate). Eccentric is held in position by spring tension and no locknuts are used. Adjustments should be made with brakes at room temperature (will drag when cold if adjusted hot).

Major Adjustment (For New Linings):—Special adjusting gauge (MT-19-C) or cutaway drum must be used to check shoe clearance. Before making adjustments, set both anchor pins in minimum position by loosening locknuts on backing plate and turning anchor pin until arrow on inner end points toward adjacent wheel cylinder. Install gauge and turn so that gauging point is at heel (lower end) of forward shoe. Turn anchor pin in clockwise direction (left hand side of car), counter-clockwise direction (right hand side of car) to move shoes out toward drum until clearance is exactly .006", tighten anchor pin locknut. Rotate gauge to toe (wheel cylinder end) of shoe, adjust eccentric cam adjuster on backing plate until clearance is exactly .007". Repeat these adjustments for rear shoe (keeping in mind that anchor pin end and wheel cylinder end of shoe reversed from those on forward shoe), then adjust wheel on opposite side of car in same manner (anchor pin must be turned in opposite direction as directed above).

CAUTION—Anchor pins must always be turned to minimum adjustment position (with arrow on inner end pointed toward adjacent wheel cylinder)

before adjustments are made. If this is not done, shoes will not be centralized in drum even though clearances are correct. Anchor pin inner ends are flattened so that wrench can be applied at this point and arrows checked while pins are being turned.

Brake Pedal Adjustment:—Brake pedal must have ⅛-¼" free travel to insure the master cylinder piston being back against its stop and compensating port uncovered when brakes released in order to provide for correct compensating action (brakes will drag if this port blocked). To adjust, loosen locknut on master cylinder end of pedal rod, turn large adjusting nut.

Chrysler C33 Note—See Bendix Vacuum Power Cylinder article for master cylinder pushrod adjustment (power cylinder adjustment will be disturbed unless adjustments made exactly as directed).

SERVICING:—Bleeding Brake Lines—Fill master cylinder supply tank with fresh fluid, attach bleeder hose to bleeder screw in center of **upper** wheel cylinder, submerge end of hose in fluid in clean glass container. Loosen bleeder screw ½-¾ turn, bleed line by pumping brake pedal slowly through one-half of pedal travel until fluid flow from hose is continuous and no air bubbles are evident. Then close upper bleeder screw. Connect hose to lower cylinder bleeder screw in center of **lower** wheel cylinder, open bleeder screw ½-¾ turn and bleed line between two brake cylinders in same manner. This is important.

Wheel Cylinders—Wheel cylinders (two per wheel) are single acting type with one piston. Pistons have rubber 'piston ring' in groove on piston (no separate piston cups used). To remove piston ring from piston, roll ring off end of piston. Install this rubber ring with lip on ring in toward inner end of cylinder and install piston spring with small end in (large end toward piston).

Master Cylinder—Same as for other Lockheed Brake systems.

Refer to 'Lockheed Double Anchor Type' brake article or 'Hydraulic Brake Servicing' article in Mechanical Equipment Section of manual for servicing data.

BENDIX VACUUM CYLINDER INTERNAL VALVE TYPE

Std. Equipment On:

CHRYSLER, CROWN IMPERIAL C33 (1941)

TYPE:—This vacuum cylinder is internal valve, reactionary (vacuum suspended) type similar to design used on previous Chrysler models. An intake air cleaner has been added and linkage has been redesigned due to new location of brake master cylinder and new type brake pedal mounting.

ADJUSTMENT:—Note—Adjustment required only when master cylinder or vacuum power cylinder removed from car or disassembled (setting not disturbed by minor brake adjustment). CAUTION—Do not readjust vacuum cylinder linkage to compensate for normal brake wear—see Lockheed brake articles for brake adjustment instructions.

Adjustment:—Make following adjustments in order:

1. Remove clevis pin connecting power cylinder pullrod to operating lever and pin connecting brake master cylinder pushrod to operating lever, loosen screws in valve lever and loosen vacuum cylinder mounting stud locknuts.

2. Adjust brake pedal toeboard clearance by loosening locknut and turning stopscrew on pedal shank to rear of pedal shaft.

3. Adjust master cylinder pushrod for correct free play by loosening locknut and turning pushrod. CAUTION—Make certain that all clearance of pedal shaft is to front of shaft while making this adjustment.

4. Hold brake pedal back against its stop and adjust vacuum cylinder so that all clearance of pedal shaft is to front of shaft and vacuum cylinder pullrod clevis pin will just slip in clevis, tighten vacuum cylinder mounting stud locknuts and install clevis pin, tighten valve lever screws.

5. Check to see that all clearance between vacuum cylinder valve rod bushing and pin is to front of pin.

SERVICING:—Lubrication—At 6000 mile intervals, lubricate power cylinder by removing plug on front of cylinder and inserting one ounce of shock absorber fluid, transformer oil, or ice machine oil. At the same time, disconnect vacuum line connection at rear end of cylinder and insert an additional ounce of oil at this point.

FORD-LOCKHEED TYPE

Used On:

FORD, ALL PASS. CAR & TRUCK MODELS (1941)
MERCURY, MODEL 19A (1941)

These Brakes same design as used on 1940 models.

TYPE:—Same design as used on corresponding 1940 models with independent hand brake on propeller shaft on some truck models as follows:

¾ & 1 Ton—Hand lever actuates rear wheel service brakes. Adjustment instructions given below.

All Trucks except ¾ & 1 Ton—Parking brake consists of an independent drum and brake band on the propeller shaft directly back of the transmission. For hand brake adjustment on these models, see Ford Truck 'M' page.

ADJUSTMENT:—Before adjusting, jack up all four wheels, remove one front wheel and inspect lining (to determine if new linings required), re-install wheel. Check front wheel bearing adjustment, spring shackles, shock absorber links, and radius rod mountings, tighten steering connections. Place hand lever in released position. Adjust each wheel as follows:

Minor Adjustment (For Wear):—Install wrench on eccentric adjusting cam on backing plate with wrench handle upward, turn cam by moving wrench handle out toward wheel rim until shoe is tight in drum, then turn cam back until wheel just turns freely without drag (do not turn cam back more than enough to free wheel, desired setting is with least possible amount of clearance). After adjusting forward shoe, repeat adjustment on rear shoe, then adjust all other wheels in same manner. Check pedal reserve, if reserve less than half total travel, repeat adjustment (if pedal is 'spongy', bleed lines). Check brake pedal clearance and adjust hand brake (see instructions below).

Major Adjustment (For relined brakes, etc.):—NOTE—Before installing brake drums, loosen eccentric anchor pin locknuts and turn each anchor pin so that marks on flatted ends of pins are together (marks indicate 'high' side of eccentric and in this minimum position will allow drums to be installed over new linings). Adjust eccentric adjusting cam for each shoe (see Minor Adjustment above), then adjust anchor pins as follows: Depress brake pedal with 25-35 lbs. pressure (hold in this position while making adjustments), use wrench with 3" handle and turn eccentric anchor pin so that mark moves down until brake shoe is felt to contact drum, hold anchor pin from turning and tighten locknut securely. Release brake pedal, check wheel to see that it turns freely without any drag, repeat adjustment if wheel drags. This setting designed to secure less clearance at anchor pin or heel end of shoe than at toe with only slight clearance for entire shoe. Adjust both shoes in each wheel in this manner, check brake pedal clearance and adjust hand brake as directed below.

Brake Pedal Adjustment:—Brake pedal must have ¼-½" free movement (measured at pedal pad) to insure master cylinder piston being against its stop for correct compensating action when brakes released. To adjust, loosen locknut on pedal rod, turn rear section of rod (integral with large adjusting nut—not necessary to disconnect clevis pins), tighten locknut.

Parking (Hand) Brake Adjustment (Passenger Cars):—Place hand lever in fully released position. Use pedal jack to depress brake pedal so that rear brake shoes applied firmly against drums (leave in this position while adjusting). Pull forward on cables to remove all slack, adjust clevis on end of hand brake cable. Release pedal jack and check adjustment. End of hand brake lever should move ½" before all slack in cable is taken up and wheels should be free with hand brake lever released.

¾ & 1 Ton Models—Place hand lever in fully released position, use pedal jack to depress brake pedal so that rear brake shoes applied firmly against drums (leave in this position while adjusting). Disconnect both wheel cables at intermediate lever on frame, loosen locknut and adjust clevis on forward end of each cable so that all slack removed when cables re-connected. Release pedal jack, adjust clevis at intermediate lever end of hand lever so that ½" movement of hand lever tip required to remove all slack from cables and that bolt on intermediate lever bracket is in center of slot with hand brake applied.

Other Trucks—These models have independent hand brake on propeller shaft. See Ford Truck 'M' page for data.

SERVICING & OVERHAUL: — Same as for previous models with Hydraulic Brakes. ***Refer to manual (or 1939 Supplement) Mechanical Equipment Index for 'Ford-Lockheed Type' Hydraulic Brakes for servicing data.***

CHEVROLET (OWN) HYDRAULIC TYPE

Used On:

ALL PASSENGER CAR & TRUCK MODELS ('41)

These Brakes same design as used on corresponding 1940 car and truck models except for minor changes.

DESCRIPTION:—Brakes are same general design as used on 1940 models with following features:
Front Brake Adjustment Slots—Slots provided in front wheel backing plates (closed by snap covers) on Passenger Cars and Trucks so that brakes can be adjusted without removing wheels.

Hand Brake (Passenger Cars)—New type idler lever mounted on bracket welded to second cross-member (at rear of transmission) and linked to each rear wheel by cable with adjustment on each cable at idler lever end (see adjustment data below).

ADJUSTMENT:—Jack up all four wheels. Disconnect hand brake cables at idler lever (Pass. Cars), hand brake rods at cable connectors (Trucks). Adjust each wheel as follows.

CAUTION—Hand brake rods must be disconnected to eliminate any possibility of shoes being held on by cables which would make it impossible to secure satisfactory brake adjustment.

Adjustment (Except 1½ Ton Rear Wheels). Insert screwdriver in slot on backing plate at each end of wheel cylinder so as to engage notched adjusting covers on cylinder (adjusting cover on each end of cylinder controls one shoe), turn adjusting covers until shoe has slight drag on drum, then back cover off exactly 4 notches (all models except 1½ Ton Truck front wheels), 5 notches (1½ Ton Truck front wheels) to provide correct clearance. Adjust all wheels in this manner, then adjust parking brake (see below) and check brake pedal clearance.

Adjustment (1½ Ton Truck Rear Wheels). Wheel cylinder adjusting covers turned by means of hexagonal-headed pinion shafts on backing plates. Turn each pinion shaft clockwise until shoe has slight drag on drum, then turn pinion shaft back ¾ turn for correct clearance, adjusting parking brake (see below) and check brake pedal clearance.

Parking Brake Adjustment (Passenger Cars):—Place hand lever in fully released position. Loosen both check nuts on each wheel cable at idler lever on frame cross-member at forward end of cables, pull cables forward out of conduit until definite stop is felt, hold cable in this position and tighten both check nuts on each cable so that cable is locked to idler lever toggle. Check to make certain that rear wheels are free.

Adjustment (Truck Models). Place hand lever in fully released position. Pull wheel cable end fitting (at front of rear frame cross-member) forward until a definite stop is felt, hold cable in this position, turn nut on forward rod down until it contacts (turn by hand only, do not use wrench), lock cable by turning rear nut up securely. Check equalization and make any necessary re-adjustment by loosening wheel cable to tight wheel slightly (do not change wheel cylinder adjusting cover setting).

Toggle Lever Adjustment (When new Shoes Installed). With brake drum removed, loosen eccentric bolt locknut (on web of one shoe), hold toggle lever against shoe, turn eccentric bolt until there is only slight clearance between lever and bottom of slot in hand brake extension link, tighten eccentric bolt locknut and recheck clearance.
NOTE—This toggle arrangement not used on 1½ Ton truck models.

Brake Pedal Clearance:—Clearance between pedal and underside of toeboard must be ¼" to insure master cylinder piston being back against its stop for correct compensating action when brakes released (clearance between edge of master cylinder piston primary cup and center of compensating port must be .035" min.). Adjust each model as follows:

Passenger Cars. Loosen locknut on eccentric bolt (linking pedal and master cylinder piston rod), turn bolt until correct toeboard clearance secured, tighten locknut.

Truck Models. Loosen locknut at clevis on rear end of master cylinder pushrod, turn pushrod until correct toeboard clearance secured, tighten locknut.

SERVICING:—All service operations including Bleeding of Brake Lines, Brake Shoe Removal & Installation, Master Cylinder & Wheel Cylinder Overhaul same as for previous models. ***See 'Chevrolet (Own) Hydraulic Type' brake article in Mechanical Equipment Section of manual for complete instructions and note following data:***

Brake Shoe Installation (Pass. Cars, ½ & ¾ Ton Models)—When installing shoes, make certain that they contact pads on anchor plate (3 pads for each shoe) by checking clearance between shoe and each pad with .002" feeler gauge. If shoes do not contact all pads, bend anchor plate.

Brake Drag (Trucks)—With severe service, wheel cylinders and pistons may become gummy from fluid and lining dust deposit. Correct by thoroughly cleaning cylinders and pistons (should also be done when brakes relined).

HUDSON VACUMOTIVE TYPE

Optl. Equipment On:
HUDSON, ALL MODELS (1941)

SPECIAL SERVICE NOTE & PRODUCTION CHANGE:—To correct complaints of Governor Switch not functioning or operating at incorrect speed (see Governor Switch data below) on first cars, install new Governor Switch, Part No. 162866, marked by Orange dots on terminal screws and Orange band around switch body. This new type Governor Switch has shaft bushings with reversed oil groove to prevent transmission lubricant working up into switch body and is installed at the factory on later cars.

DESCRIPTION & OPERATION:—Vacumotive Clutch Control consists of an internal valve type Vacuum Power Cylinder linked to the clutch throw-out mechanism so that the clutch can be operated manually (by depressing clutch pedal) or automatically (with engine running and 'off-on' switch control button on instrument panel pushed in) with accelerator pedal control. Clutch is disengaged whenever accelerator pedal released (except at speeds above 15 MPH. in high gear—see High Gear Lock-out below) and engages as soon as accelerator pedal is depressed to accelerate car. Solenoid valve mounted on forward end of cylinder controls High-gear lock-out control and special open-throttle rapid-engagement only (see description below) and does not affect normal clutch control operation. Control operates as follows: When engine is started, vacuum line to forward end of cylinder will be open (solenoid valve open), control valve within piston rod will be drawn forward admitting air to rear end of cylinder and piston will move forward to disengage clutch. When accelerator pedal is depressed, first motion of linkage moves control valve lever forward (rapid motion permitted by clearance between cushion point stop-screw and valve lever cam) pulling control valve to rear so that vacuum admitted to rear end of cylinder, piston spring then engages clutch rapidly until cushion point is reached when piston overtakes control valve and seals off rear end of cylinder. Further movement then possible only as valve lever cam is rotated under cushion point stop-screw so that very soft cushioning action or initial clutch engagement is secured. As soon as accelerator linkage play is taken up and carburetor throttle begins to open, final clutch engagement takes place rapidly (valve lever cam has special contour to secure this action). Clutch control designed to modify this normal engagement for special conditions as follows:

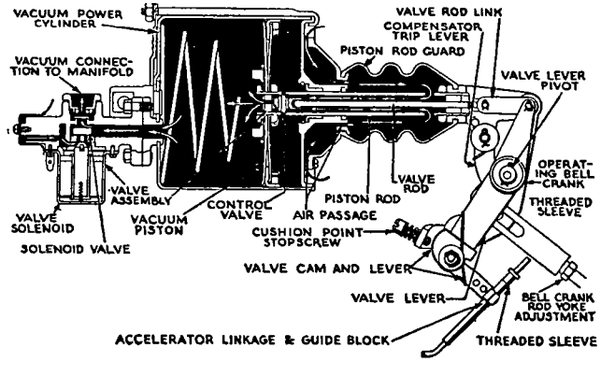
Compensator (For Initial Engagement)—When clutch disengaged manually (necessary to start engine), the end of the bell-crank yoke strikes a pin on the end of the intermediate lever (on which valve lever is mounted) swinging lever so that valve lever pivot is moved forward permitting clutch to engage deeper at the cushion point to compensate for oil on clutch disc cork inserts. As soon as clutch engages automatically, trip lever on piston rod yoke rotates compensator lever back to normal driving position. No adjustment is required but compensator must be in normal driving position when other clutch control adjustments are made.

Accelerator Switch (For wide-open throttle Engagement)—Consists of a switch on the dash operated by the accelerator pedal which controls vacuum cylinder solenoid valve circuits. With throttle closed, circuit completed through switch to both Governor Switch (left hand terminal—RW wire) and to High Gear Shift Rail Switch and Selector switch (right hand terminal—Y wire). When throttle opened sufficiently to rotate accelerator switch lever 5-10°, circuit to Governor Switch is broken (eliminating Governor control). When throttle opened approximately 1/2, circuit to Shift Rail Switch and Selector ground switch is broken. With all solenoid circuits to ground broken, solenoid valve cuts off vacuum and admits air to vacuum cylinder so that clutch engages rapidly (which is desirable when car started with throttle more than half open).

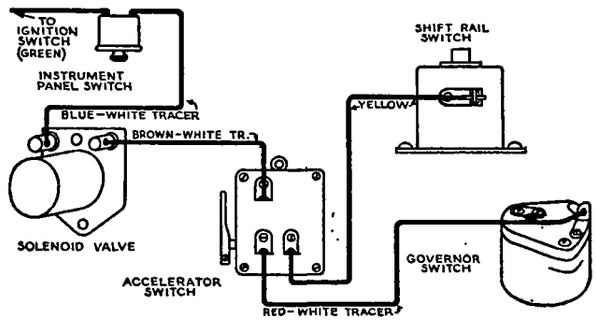
High Gear Lock-out (At speeds above 15 MPH)—This device consists of a Shift Rail Switch on the transmission case which is opened by the shift rail when the transmission is in High Gear. This prevents clutch disengaging with transmission in high gear at speeds above 15 MPH. (when Governor Switch contacts will be open).

ADJUSTMENT:—Before making adjustments, engine must be properly tuned and warmed up so it idles smoothly at correct idle speed with vacuum reading of 18-21" of mercury (see Tune-up data on car model 'T&E' page). Car should be driven suffciently to bring clutch units to normal operating temperatures. See that Compensator is in normal running position (see Compensator above) and make all Clutch, Throttle, and Automatic Clutch linkage adjustments listed below in order before adjusting 'Cushion Point' which controls clutch performance.

Clutch Pedal Adjustment—Remove clevis pin at lower end of clutch pedal connecting link, loosen locknut and turn clevis so that center of pedal shank clamp bolt is 1½" from toeboard with clutch fully engaged.



Clutch Control Linkage Adjustment—See that linkage works freely without binding. Adjust accelerator switch to bell crank rod so that clevis pin at switch end just slips into place with switch lever against the stop. See that valve lever cam operating rod is connected in correct hole in accelerator pedal link bell crank, adjust threaded sleeve on rear end of the valve lever cam operating rod so that distance from end of threaded sleeve to end of rod is 11/16" (10,11,12,18), 1 5/32" (14,15,17).



Vacuum Cylinder Bell-crank Yoke—With engine not running, and vacuum cylinder piston in extreme rear position, take out cotter pin in valve lever pivot and at end of valve-rod-and-lever link, remove valve lever, adjust yoke at bell-crank end of operating rod so that clearance between front edge of clevis pin on bell-crank and front end of slot in yoke is ⅛". This setting will provide clearance at clutch throw-out bearing (with clutch engaged) without excessive play in operating linkage.

Piston Travel (Valve Linkage)—Make certain that valve cam lever operating rod guide block is mounted in rear (end) hole of cam lever, and compensator pin in extreme rear position, operate engine to provide vacuum. With clutch disengaged, screw threaded sleeve (on operating rod at valve cam lever guide block) toward dash until piston rod just reaches its extreme forward position, then screw threaded sleeve away from dash until piston moves ¼" toward rear.

Cushion Point Adjustment—With all linkage adjustments correctly made (above), block wheels and start engine (do not set brakes). Accelerate engine and manually engage and disengage clutch to dry clutch disc corks. Make certain that carburetor is not in fast idle position, back out accelerator cross-shaft stopscrew for clearance of 1/16". Swing compensator lever to rear (normal running position) turn cushion point stopscrew clockwise or in until screw contacts cam. Shift transmission to Low Gear, hold cam against stopscrew by pressing on back of cam lever, slowly turn stopscrew out or counter-clockwise until clutch drag slows engine noticeably (car will tend to move forward. Check throttle rod adjustment and then make final adjustment as directed below.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Throttle Rod Adjustment—See that valve lever cam operating rod is in correct hole in accelerator pedal link bellcrank for each model. With transmission in Low Gear and engine running, move accelerator pedal bell crank lever until valve lever cam just contacts cushion point stopscrew, hold throttle linkage in this position and turn accelerator cross-shaft stopscrew until carburetor throttle just begins to open and engine speed picks up. This adjustment should be rechecked whenever carburetor is removed from engine or linkage is disturbed.

Final Adjustment:—Shift transmission into second gear, depress accelerator pedal slowly with engine running. Car should begin to move slightly upon initial throttle opening. If clutch engagement slow and engine speed excessive, turn cushion point stopscrew counter-clockwise or out slightly. If clutch engagement too rapid (engine stalls), turn screw clockwise or in slightly. Do not turn screw more than ½ turn without rechecking performance.

TROUBLE SHOOTING:—If Automatic Clutch operation slow or erratic, check vacuum lines for leaks, tighten connections, check gaskets, solenoid for sticking plunger, all linkage for excessive friction or binding (operate accelerator and watch operation of entire linkage system). To check vacuum cylinder for piston leaks, slide piston rod guard forward until 4 ports in piston rod are exposed, start engine and allow clutch to disengage automatically, close off piston rod ports by covering with fingers, excessive leakage will cause a perceptible suction at the ports (see Piston Lubrication under Servicing below).

SERVICING:—Vacuum Cylinder Piston Lubrication—At 10000 mile intervals, remove pipe plug in end of cylinder, inject exactly one ounce of Hudson Shock Absorber fluid. Take out piston rod bolt at bellcrank and disconnect valve-rod-to-lever link, rotate piston to spread lubricant over entire piston and oil wick. Place 2-3 drops of oil in bell-crank bracket oil hole every 1000 miles.

Piston Rod Guard Replacement:—To remove rubber boot or guard on piston rod, take out cotter pin in valve lever pivot and also in valve rod trunnion at upper end of valve lever, remove lever. Take out piston rod bolt in bell-crank, remove guard from groove in piston rod end, hold piston rod from turning with drift in bell-crank bolt hole, loosen locknut against rod end, remove piston rod end, remove guard. Install guard in same manner, adjust piston rod length, adjust cushion point stopscrew when valve lever reassembled (see Adjustment above).

Piston Rod Adjustment:—Whenever piston rod end removed or disturbed, position end on rod so that distance from center of tripod mounting hole to center of bell-crank bolt hole in rod end is exactly 13 11/16", lock setting with locknut.

TESTING:—Where test lamp required in making following tests, make up test lamp using 15 cp. Mazda No. 87 bulb and suitable leads. Make tests in order given below.

Valve Solenoid:—Disconnect Blue-White (BLW) wire from valve solenoid terminal and connect this wire to one test lamp lead. Ground the other solenoid terminal to which Brown-White (B-W) wire attached. Touch the second test lamp lead to the solenoid terminal from which BLW wire removed. With ignition turned on and dash 'Off-On' switch on, lamp should show dull glow. If lamp does not light, solenoid is open. If lamp burns brightly, solenoid is shorted. If circuit is normal, remove vacuum pipe connection, bushing, and bakelite valve disc. Insert narrow scale in opening and check plunger travel under light pressure. If plunger does not move 1/16-3/32" freely, check valve disc rubber and plunger interference. Tighten vacuum connections tightly.

Dash 'Off-On' Switch & Upper Wiring Harness:—If clutch does not disengage with fully closed throttle, valve lever rod in fully forward position, and dash switch 'on' (pushed in), connect jumper wire from battery cable terminal to solenoid BLW terminal. If clutch operates, check dash switch for poor contact, check wiring from dash switch to gas gauge to ignition switch for open-circuit.

Accelerator Switch:—Disconnect Governor Switch Red-White (RW) wire at accelerator switch terminal, place transmission shift lever in High Gear, see that ignition switch and dash 'off-on' switch turned on and accelerator pedal in idle position. Ground one test lamp lead, touch other lead to accelerator switch terminal from which RW wire removed. With 5° step of No. J-1190 test gauge between switch lever and its stop, lamp should show red glow. When 10° step of gauge inserted between lever and stop, lamp should go out. Transfer test lamp lead from RW terminal to Y terminal on switch. Lamp should show red glow until throttle half open and then go out. Replace switch if defective.

Shift Rail Switch:—Disconnect the Red-White (R-W) wire at Governor Switch, check Automatic Clutch operation. Automatic Clutch should operate in all gears except High Gear. If it does not, ground shift rail switch terminal. If clutch operates satisfactorily, check switch for sticking operating ball or replace switch. If correct clutch operation not secured with shift rail switch grounded, check Yellow wire between shift rail switch and accelerator switch for open-circuits and replace wire. If automatic clutch operates with transmission in High Gear, replace switch.

Testing Wiring Harness—After testing switch for correct operation, and with Red-White wire disconnected from Governor Switch, shift transmission to high gear, turn on ignition, ground one test lamp lead, connect other lead to lower harness connector. Test lamp should show red glow. If lamp does not light, wiring is defective. Repeat test at Shift Rail and Governor Switch terminals. Recheck Accelerator switch before replacing wiring harness.

Governor Switch:—Check by road-testing or operating car with rear wheels blocked up so that engine can be run with transmission in gear. See that Red-White wire connected to Governor switch, operate engine, engage high gear. Check to see that Automatic Clutch operates when accelerator pedal is depressed and released. If it does not, replace Governor Switch. With high gear engaged, increase engine speed until speedometer reading is 25 M.P.H., release accelerator and note when clutch disengages. Clutch should be engaged at 20 M.P.H. but should disengage before speed decreases to 15 M. P.H. If clutch disengagement is not within this 15-20 M.P.H. speed range, replace Governor Switch.

PACKARD ELECTROMATIC TYPE

Optl. Equipment On:
PACKARD, ALL 1941 MODELS

SPECIAL SERVICE NOTES:—Clutch Adjustment—Clutch pedal free travel should be set at 2" on all cars with Electromatic Clutch and should be checked whenever car is serviced. To adjust, turn adjusting nut on connector link at clutch fork.

Governor Switch on Cars With Aero-Drive (Overdrive)—Governor switch has two sets of contacts and two terminals marked 'EC' and 'AD'. The 'AD' contacts are used for Aero-Drive control. See separate article on Packard Aero-Drive for data on this unit.

DESCRIPTION & OPERATION:—Electromatic Clutch Control consists of a vacuum power cylinder linked to the clutch throw-out mechanism by an overrunning type of linkage so that the clutch may be operated either manually (using clutch pedal with 'Lock-out' switch button on instrument panel pulled out), or automatically (power cylinder operation controlled by accelerator pedal). Power cylinder is actuated by manifold vacuum with accelerator pedal control (so that clutch disengaged whenever accelerator pedal released at car speeds below 17 MPH. in high gear—Governor switch prevents disengagement at speeds above 17 MPH). modified by electrically operated solenoid valves and switches to provide smooth clutch engagement under all operating conditions. Control valves and switches are used as follows:

Clutch Control Valve:—Mounted on left hand side of cylinder block and linked to accelerator pedal. Direct Speed Solenoid is mounted on underside and Low & Reverse Solenoid mounted on rear of control valve assembly. Control Valve is compound type and consists of a valve spool linked to the accelerator pedal and a valve sleeve actuated by a spring-loaded vacuum diaphragm which is subjected to same vacuum as exists in power cylinder. These two valve elements operate together to control the rate of air bleed into the power cylinder so as to provide proper clutch engagement for all normal operating conditions. Operation is modified for special conditions by Direct Speed Solenoid, Low and Reverse Solenoid and Second Speed Solenoid as follows:

Direct Speed Solenoid:—Consists of a solenoid operated master valve mounted on the control valve assembly and connected in the manifold vacuum line. This valve is closed when solenoid is de-energized so that entire Electromatic Clutch mechanism is inoperative. Solenoid is controlled by Lock-out Switch, Direct Speed Switch, Accelerator Switch and Governor Switch as follows:

Lock-out Switch—On instrument panel. This switch is connected to 'gauge' side of ignition switch and operates as a master switch for the Direct Speed Solenoid (solenoid de-energized and Electromatic Clutch inoperative when lock-out switch button pulled out). When lock-out switch button pushed in, direct speed solenoid is energized and Electromatic Clutch is operative except when circuit opened by other switches as follows:

Accelerator Switch & Governor Switch—These two switches are wired in series to control the Direct Speed Solenoid and make the Electromatic

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Clutch inoperative while the car is being operated. Accelerator switch is mounted on the dash and linked to the accelerator pedal so that the switch contacts are open and the Direct Speed Solenoid de-energized (Electromatic Clutch inoperative) while the accelerator pedal is depressed. When the accelerator pedal is released (as for gear shift), switch contacts close and solenoid is energized if car speed is below 17 MPH. At car speeds over 17 MPH., governor switch contacts 'EC' are open and direct speed solenoid is de-energized (Electromatic Clutch inoperative) except for over-riding action of Direct Speed Switch (below). NOTE—The 'AD' or second set of contacts in the Governor Switch control the Second Speed Solenoid as detailed below. These 'AD' contacts also control the Aero-Drive (Overdrive) cut-in point (overdrive operative only with these contacts closed).

Direct Speed Switch—Mounted on left side of transmission case and operated by Second-high shift lever. This switch over-rides Governor Switch so as to permit Second & High Gear shifts to be made at speeds above 17 MPH. (point where governor switch contacts open to de-energize Direct Speed Solenoid and make Electromatic Clutch inoperative). Switch contacts are closed except when transmission is in high gear and open when high gear engaged. When shift to Second Gear is desired at speeds above 17 MPH., first movement of shift lever closes switch contacts so that direct speed solenoid is energized as soon as accelerator pedal is released (circuit completed through accelerator switch).

Second Speed Solenoid Valve:—Consists of a solenoid operated choke valve in the air intake line between the air cleaner and the control valve assembly. When solenoid is energized, this valve restricts air bleed action and retards clutch engagement so as to prevent lurching or surging caused by too rapid clutch engagement with engine speed below that of car speed (retarded engagement allows engine speed to come up to that of car). Valve is controlled by Second Speed Switch and 'AD' contacts of Governor Switch as follows:

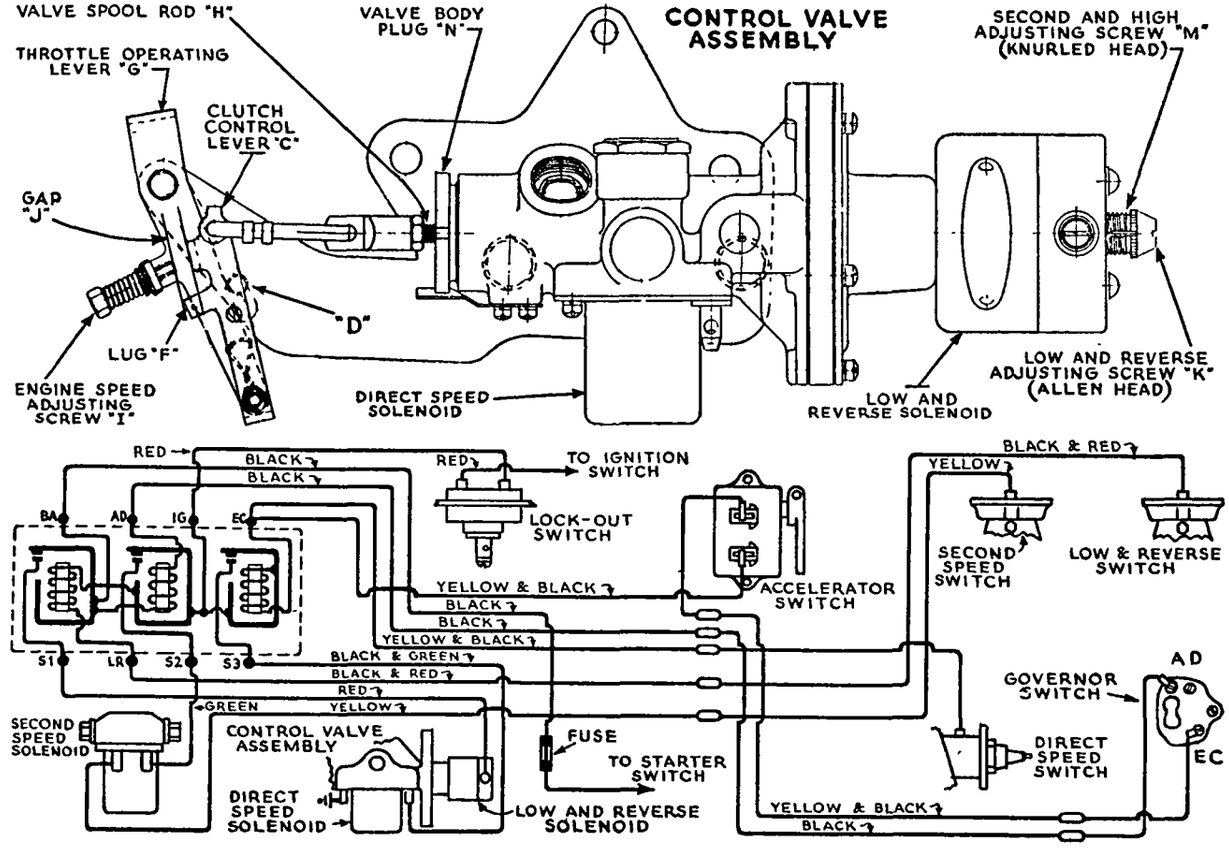
Second Speed Switch—Mounted on end of Second-High shifter rail on ride side of transmission case. Switch contacts closed (to energize Second Speed Solenoid) only when Second Gear is engaged and circuit is completed through control relay (relay contacts closed) only when Governor Switch 'AD' contacts are closed (speeds above overdrive cut-in point of 22 MPH.).

Low & Reverse Solenoid:—Mounted on rear of control valve assembly. Consists of a solenoid plunger which increases the load on the control valve diaphragm spring so as to provide slower rate of clutch engagement when starting in low or reverse gear. Operates only when solenoid energized by Low & Reverse Switch.

Low & Reverse Switch—Mounted on end of Low-Reverse shift rail on right side of transmission case. Switch contacts are closed (to energize Low & Reverse Solenoid) only when Low or Reverse Gear is engaged and are open at all other times.

Control Relay:—Three-unit, eight terminal relay mounted on dash. Relay completes Electromatic Clutch circuits as shown on wiring diagram.

ADJUSTMENT:—**Note**—Before making adjustments, clutch pedal free movement should be checked and set to 2", engine must be tuned up and adjusted for smooth idling performance. With engine warm and idling at correct hot or slow idle speed of 8-10 MPH., make following adjustments in order:



Accelerator & Throttle Linkage—Adjust carburetor cross-shaft lever linkage so that, with throttle operating lever 'G' (refer to Control Valve illustration) against stop pin 'D', the carburetor throttle lever is against the throttle stopscrew and the linkage is free and has normal play. Loosen locknuts and adjust turnbuckle on rod linking lever 'C' to accelerator pedal so that, with lug 'F' on lever holding lever 'G' against stop pin 'D', the clearance at the stop on the right end of the accelerator cross-shaft is 1/32-1/16".

Engine Speed Adjusting Screw Gap—With throttle control valve lever stop against throttle lever 'G', adjust engine speed adjusting screw 'I' so that gap between end of screw and lever 'C' is 7/32" as shown at 'J'.

Valve Rod Adjustment—Depress accelerator pedal just enough to take up clearance between engine speed adjusting screw and clutch control lever ('J' on illustration), adjust valve spool rod at 'H' until power cylinder piston rod just begins to move out of power cylinder (if piston rod begins to move before clearance taken up, screw valve spool rod out of clevis; if piston rod does not move when clearance taken up, screw rod into clevis). To check adjustment, with engine warmed up and idling and gear shifter lever in neutral, shift into Low Gear and slowly press on accelerator pedal. Car should start to creep forward at engine speed of approximately 900 RPM. If engine speed too high, increase gap by turning engine speed adjusting screw 'I' out, if engine speed too low, decrease gap by turning screw in (adjust ¼ turn at a time and recheck performance). IMPORTANT—Recheck engine speed adjusting screw gap (above) after making this adjustment. If original setting of 7/32" changed by more than 1/32", readjust valve spool rod by turning rod ½ turn out of clevis (gap too small), ½ turn in (gap too great). Recheck performance and readjust engine speed screw gap and valve spool rod until correct performance secured (low gear start at 900 RPM. with engine speed screw gap of 7/32" ±1/32").

Low & Reverse Engagement—This adjustment changes Second & High Engagement adjustment and should be made first. To check operation, turn ignition switch on (engine need not be started), place gear shift lever in Low Gear position, note whether adjusting screw 'K' on end of Low & Reverse Solenoid moves into solenoid body. If screw moves, adjustment is satisfactory. Check performance by operating engine, shifting into low gear, and depressing accelerator pedal. If clutch grabs (engagement too rapid), turn adjusting screw 'K' (Allen head screw—not knurled screw which is Second & High Engagement adjustment) ¼ turn at a time until smooth engagement is secured at engine

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

speed not in excess of 900 RPM. If clutch slips (engagement too slow), turn adjusting screw out ¼ turn at a time until smooth engagement secured at not more than 900 Engine RPM. CAUTION—Adjusting this screw 'K' changes engine speed (turning screw in increases engine speed, turning screw out decreases engine speed). Check Valve Rod Adjustment (above) after making this adjustment. Then adjust Second & High Engagement as follows:

Second & High Engagement—After completing Low & Reverse Engagement adjustment (above), check second and high performance by making a Second Gear start. Car should just start to creep forward in Second gear at engine speed of 700 RPM. If clutch grabs (engagement too rapid), turn knurled adjusting screw 'M' (not Allen head screw) on end of Low & Reverse Solenoid body in ¼ turn at a time until smooth engegement is secured with engine speed not to exceed 700 RPM. If clutch slips (engagement too slow), turn adjusting screw 'M' out ¼ turn at a time until clutch begins to grab, then turn screw in ¼ turn at a time until smooth engagement is secured with engine speed not to exceed 700 RPM. CAUTION—Adjusting this screw changes engine speed (turning screw in increases engine speed, turning screw out decreases engine speed). Check Valve Rod adjustment (above) after making this adjustment.

Full Throttle Engagement—Check by road testing car and starting in Second Gear with full throttle. Adjust by turning Control Valve body plug 'N' (see illustration) out until clutch grabs, then turn plug in one notch at a time until smooth engagement is secured without causing engine to 'stumble'. (NOTE—Plug should not be turned in more than necessary, this setting should be made to secure fastest possible engagement without engine stumbling). If clutch slips and engine races during intermediate part of clutch engagement, back out Second & High Engagement adjusting screw 'M' (see above) to reduce slip.

Second Gear Shift-down from High—Adjust Direct Speed switch (on transmission case) as follows: Remove wire from switch terminal and connect test light in line between this wire and terminal on switch. Place steering column shift lever in High Gear position. Turn on ignition switch without starting engine. Test lamp should not be lighted. Move gearshift lever toward neutral. Lamp should light just after all slack in linkage is taken up but before shifter lever on transmission case moves out of detent. Adjust switch bracket to secure this setting (rotate bracket to move switch toward front of car for earlier closing of switch and lighting of lamp).

Accelerator Switch Adjustment—Adjust Accelerator Switch as follows: Remove either wire from switch terminal, connect test lamp between this terminal and battery terminal on control relay (hot lead). With ignition switch turned off and accelerator pedal fully released, lamp should light. Depress accelerator pedal slowly and note point at which lamp goes out. Lamp should go out just after stop on control valve lever 'C' contacts engine speed adjusting screw 'I' and gap 'J' has been taken up (refer to Control Valve illustration) but before carburetor throttle lever starts to move. Adjust by loosening locknuts and turning turnbuckle on rod linking accelerator switch to accelerator crossshaft. Shorten the rod if the lamp goes out too soon, lengthen the rod if the lamp does not go out until after carburetor throttle lever starts to move.

Final Performance Check:—After making above adjustments, road test car and note performance when starting under all conditions. If clutch grabs or slips, readjust as directed above.

CHECKING ELECTRICAL UNITS:—Check Fuse, Control Switches, Control Relay, and Solenoids in order as directed below. NOTE—Switches should not be repaired and defective units should be replaced.

Control Relay Fuse:—Located in lead between starting switch and relay. If fuse is blown, check for shorted relay terminals (particularly 'BA' and 'S1' terminals), and shorted relay as follows: Disconnect lead at relay 'BA' terminal, connect test lamp between this wire and ground, install new fuse. Move wire back and forth to check for shorts. Lamp should burn steadily, if lamp blinks or fuse blows, lead is grounded. Examine relay terminals and make certain they are not shorted to dash. Check relay by removing grounding clip and touching test lamp lead to 'BA' terminal. If lamp lights, terminal or relay is shorted and relay should be replaced.

Control Switches:—Check each switch as follows (replace defective units):

Direct Speed Switch—Turn on ignition without starting engine, depress accelerator pedal to open accelerator switch, move gearshift lever back and forth between High Gear and Neutral. Relay should click when switch makes and breaks circuit. If no click noted, check switch adjustment (see 'Second Gear Shift-down from High' above) before replacing switch.

Low & Reverse Switch—Turn on ignition without starting engine. Move gearshift lever back and forth between Neutral & Low and Neutral & Reverse. Relay should click when contact is made as gear is engaged and also when contact is broken when gear disengaged. If no click noted, check Low & Reverse Switch adjustment (see Adjustment section above) before replacing switch.

Second Speed Switch—Remove Yellow wire from second speed solenoid, connect test lamp between this wire and 'hot' terminal on starter switch. Lamp should light when gearshift lever placed in Second Gear position and go out when gearshift lever moved out of second gear.

Accelerator Pedal Switch—See adjustment directions in Adjustment section above.

Governor Switch—To check 'AD' contacts, disconnect wire from 'AD' terminal on control relay, connect test lamp between this wire and the 'AD' terminal. Lamp should not light with ignition turned on or off. To check 'EC' contacts, disconnect wires on both 'AD' and 'EC' terminals on control relay, connect test lamp between wire removed from 'EC' terminal and the 'AD' terminal of the relay. Place gearshift lever in High Gear position. Lamp should light.

Lockout Switch—Connect test lamp between 'IG' terminal on control relay and ground on dash. Turn ignition on. Lamp should light with lock-out switch button pushed in and should go out when button is pulled out.

Control Relay:—Check each winding (3 units) individually as follows:

S1 Winding—Connect test lamp between 'BA' and 'IG' terminals, see that ignition turned off, disconnect one wire from accelerator switch, place gearshift lever in high gear position, disconnect wire from 'LR' terminal. Grounding this terminal should cause test lamp to light. If lamp does not light, relay winding is open. See also S3 Winding test below.

S2 (Center) Winding—Connect test lamp to 'BA' terminal, touch other test lamp lead to 'AD' terminal. If lamp lights, S2 winding is shorted or Governor Switch 'AD' contacts are sticking closed (see Governor Switch testing above).

S3 Winding—Connect test lamp between 'BA' and 'IG' terminals. Lamp should be lighted with ignition turned off. Place gearshift lever in High Gear position, disconnect one wire from accelerator switch and disconnect wire from relay 'LR' terminal. If lamp remains lighted, 'EC', 'IG', or 'LR' terminals are grounded, S1 or S3 windings are grounded, or lockout switch or wiring is grounded. Install accelerator switch wire. Lamp should light, if lamp not lighted move gearshift lever to Neutral. If lamp lights, Accelerator Switch or Governor Switch 'EC' contacts are sticking open. If lamp does not light, S3 winding is open or direct speed switch does not close properly.

Relay Specifications

Contacts Close—2.8-3.6 volts (all units). Adjust by bending lower spring hanger slightly.

Contacts Open—1.8-2.6 volts (all units) when decreasing voltage from 6 volts. Adjust by varying height of stationary contact.

Contact Gap—.010" minimum (all units).

Air Gap—.030-.034" (all units) measured at center of core. Adjust by bending armature stop.

Solenoids:—Check each solenoid as follows:

Second Speed Solenoid—Make certain that ignition turned off and that gearshift lever in Neutral. Connect one test lamp lead to 'hot' terminal on starter switch, touch other test lamp lead to both terminals of Second Speed Solenoid Valve. If lamp lights, solenoid winding or terminals are grounded. To check for open-circuit, connect test lamp lead to one terminal, ground other terminal with ignition turned on. If lamp lights, winding is not open.

First & Reverse Solenoid—With one test lamp lead connected to 'hot' terminal on starter switch, touch other test lamp lead to Low & Reverse solenoid terminal. If lamp lights, winding is not open. Disconnect wire at Low & Reverse Solenoid terminal, connect test lamp between this wire and ground. Turn ignition on and ground relay 'LR' terminal or place gearshift lever in Low or Reverse position. Lamp should light. If lamp does not light, check Low & Reverse engagement (see Adjustment section above).

Direct Speed Solenoid—With one test lamp lead connected to 'hot' terminal on starter switch, touch other test lamp lead to Direct Speed Solenoid terminal. If lamp lights winding is not open. To check solenoid wiring, turn ignition on, ground one test lamp lead and touch other lead to direct speed solenoid terminal. Lamp should light. If lamp does not light, Governor Switch 'EC' contacts are open or accelerator switch is defective or out of adjustment. Check both switches as directed above.

SERVICING:—Power Cylinder—Piston seal is oiled when assembled and does not require periodic lubrication. If piston becomes dry or sticks (piston rod motion will be jerky or rough), piston should be removed from cylinder and dipped in Bendix Vacuum Cylinder oil before being re-installed. NOTE—Above data applies to Piston type power cylinder. Diaphragm type power cylinder used on later cars.

Air Cleaner—Cleaner is dry type (do not oil cleaner element). When cleaner becomes dirty, filter should be replaced.

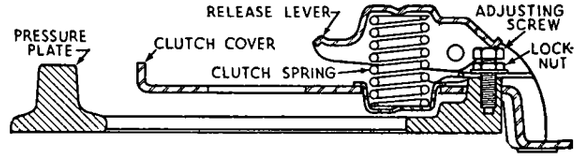
Control Valves—Valves are calibrated for particular model on which installed and should not be interchanged from one model to another.

ATWOOD TYPE

Model TP-28-7

WILLYS AMERICAR & PLAINSMAN, MODEL 441 (1941)

Model TP-28-7-1



WILLYS, PICK UP MODEL 441 (1941)

WILLYS, PANEL DELIVERY MODEL 441P (1941)

NOTE:—These models equipped with new Atwood-Thelander Driven Member TD-22-14 with hydraulic type dampener. NOTE—If Borg & Beck Driven Member used, this is same type used on 1940 models.

TYPE:—New design, single plate, dry disc type. Clutch cover consists of a three-legged spider with channel section legs in which the clutch springs and release levers are mounted. Release levers pivot on pins riveted in cover legs and actuate pressure plate through adjustable screws in pressure plate under outer end of each lever. Springs are mounted in cups on cover under each lever. Hairpin type retracting springs are mounted on each adjusting screw and are retained by the adjusting screw locknut.

SERVICING:—Disassembly—Release lever pivot pins need not be removed for pressure plate servicing. To remove pressure plate, back off adjusting screw under outer end of each release lever until screws are free from pressure plate, remove pressure plate from beneath clutch cover spider.

Clutch Springs:—Three springs used (one spring under each release lever). Spring pressure should be 195 lbs. compressed to 1 9/16".

Release Lever Adjustment:—Lever height should be checked with special ring gauge (hardened, ground ring .310"±.010" assembled in clutch (or under pressure plate if clutch mounted on servicing fixture) in place of regular driven member. Loosen locknut on adjusting screw under outer end of each lever, and adjust each screw so that lever height (from face of flywheel or top face of servicing fixture to upper contact point on inner end of lever) is 1 15/16" ± 1/64" or 27/32" from outer face of clutch cover to top of release levers. All levers must be set exactly alike.

Reassembly:—When reassembling pressure plate, thread adjusting screws through locknut and retracting spring, and into pressure plate hole. Adjust release levers (above) before tightening locknuts.

DRIVEN MEMBER:—Atwood-Thelander Model TD-22-14. This model has hydraulic type dampener in hub which consists of four coil spring and plunger units operating in oil which provide dampening action similar to that of a direct-acting shock absorber. Entire dampener assembly is sealed within two cupped discs and cannot be serviced.

Facings—Facings are riveted individually to plate which is made up of spring segments riveted on hub. See car model 'M' page for facing specifications.

BORG & BECK

DODGE, D19 TAXICAB (1941)
PLYMOUTH, P11, P12 TAXICAB (1941)

NOTE:—Assembly Number—This number stamped on each clutch cover and may be used to identify each installation.

Borg & Beck Driven Members—Used with clutches of other makes on the following car models: Buick 40, 50, 60, 70, 90 (part production only—these cars also use Long 'CF' type driven member). NOTE—If Borg & Beck driven members used on Willys models (with Atwood Clutch), these are same as types used on corresponding 1940 cars.

Chrysler C28, De Soto, Dodge Models with Fluid Drive—These cars use smaller (9¼") clutch than cars without Fluid rive and clutch does not have Baffle Plate. These models require special lever setting as given below.

Oldsmobile 6 & 8—These clutches used only on cars with conventional transmission. No clutch used on cars with Hydra-matic Drive which has a Fluid Coupling.

SPECIAL SERVICE NOTES:—Chrysler Clutch Fixture—New type, No. C-585, Clutch Fixture available for servicing of all Chrysler Clutches. This fixture has special spacers for different lever settings of all 1941 Chrysler clutches. Old type C-411 fixture can be used for servicing of 1941 clutches if new 'E' feeler gauge No. C-411-40, secured for use in setting levers on Chrysler C28, De Soto, Dodge clutches used on cars with Fluid Drive (these clutches require new lever setting). See Service data below for instructions in use of both the C-411 and C-585 clutch fixtures.

DESCRIPTION:—Same design as used on corresponding 1940 car models with following special features:

Chrysler C28, De Soto, Dodge (Without Fluid Drive); Plymouth; Chrysler, De Soto, Dodge, Plymouth Taxicab Models—These models have Pressure Plate Baffle and Borglite Driven Member. Baffle plate installation directions and special release lever settings are given below.

Chrysler C28, De Soto, Dodge (With Fluid Drive)—These cars have smaller clutch with Borglite Driven Member but do not use a Baffle Plate. Special release lever settings are required as given below.

De Soto, Plymouth Models—Clutches on these cars have special grease pads installed on top of driving lugs on pressure plate. See Assembling Note below for grease pad data.

Chrysler C-30, C33 (With Fluid Drive)—Driven member has solid hub (no spring dampener) and has oil deflector discs on plate at inner rim of facings (baffle has inner rim cupped in deflector).

Oldsmobile—These clutches same as 1940 types and have Pressure Plate Baffle, Borglite Driven Member, and special 'duck-bill' type release levers (lever ends flattened so that no release bearing plate required). Baffle plate installation directions and release lever settings are given below.

SERVICING:—Mark all parts before dismantling clutch and reassemble in same position (necessary to maintain balance). Replace grooved, checked or warped pressure plates. Replace springs when pressure plate discolored from heat (test springs as directed below).

Dismantling:—Place clutch on fixture or arbor press (support pressure plate under release levers), place block across cover resting on spring bosses, compress cover slightly, remove metal staking in adjusting nuts, remove nuts, release pressure slowly, remove cover and springs. Remove release levers by grasping lever and eyebolt between thumb and forefinger, so that inner end of lever and upper end of eyebolt are pressed together. Lift strut over ridge in end of lever (press lower end back against lug), lift lever and eyebolt out.

Clutch Springs:—Note spring color and install in same relative position (groups of two different springs used on some clutch models). Springs should check with table below. Replace springs if weak or burned or if clutch has been subjected to excessive heat.

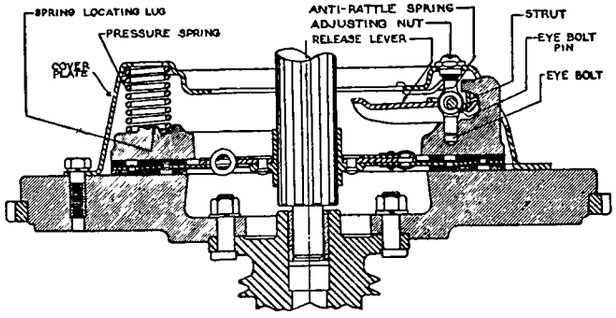
Clutch Springs

Car Model	Spring Part No.
Chrysler C28 Std.	4039 (9)
Chrysler C28 Fluid Drive	4190 (9)
Chrysler C28 Taxicab	3951 (6), 3814 (6)
Chrysler C30, C33	4039 (12)
De Soto S8 Std.	3951 (9)
Dodge D19 Std.	3951 (6), 3814 (3)
De Soto & Dodge Fluid Drive	4190 (9)
De Soto & Dodge Taxicab	3817 (4), 3814 (8)
Nash 4140	4446 (6)
Nash 4160, 4180	4039 (9)
Oldsmobile 6	4190 (9)
Oldsmobile 8	4214 (9)
Plymouth P11, P12	4308 (9)
Plymouth Taxicab	3817 (4), 3814 (8)
Studebaker Champ. 3G	4211 (6)
Studebaker Comm. 11A	4331 (9)

NOTE—Number shown thus (9) indicates number of springs used (for each type where several types used).

Spring Specifications

Part No.	Pressure (at 1 11/16")	Color
3814	130 lbs.	Purple
3817	105 lbs.	Green
3951	150 lbs.	No Color
4039	160 lbs.	Light Blue
4190	155 lbs.①	Tan
4211	165 lbs.①	Orange
4214	170 lbs.	Light Green
4308	145 lbs.①	Lavender
4331	135 lbs.①	Yellow
4449	170 lbs.①	Orange



①—Spring length 1½".

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Assembling:—Place pressure plate on fixture or arbor press supporting plate under release lever lugs. Install baffle plate (some models only—see data below), install lever, eyebolt, and strut assemblies by reversing removal procedure. Place pressure plate springs on plate, install anti-rattler springs in cover, place cover on pressure plate. Make certain that springs are seated in cover recesses and anti-rattler springs in place on release levers. Compress cover slowly and guide eyebolts through holes in cover. If assembly made in fixture, use clamps to clamp cover flange to plate at mounting holes. Install eyebolt nuts and turn nuts down flush with head of bolt. Compress and release clutch several times to seat all working parts. Then adjust release lever heights.

De Soto, Plymouth Grease Pads—Install grease pads on top of driving lugs making certain that holes in pads are over eye bolts. If pads are dry, dip them in

good quality high-melting point grease which has been heated and allow pads to drain before installing. Pads are not furnished for service.

Baffle Plate Installation (9A7, 10A6, 10A7)—Install baffle plate on pressure plate with baffle plate ears on special low spring seat ribs (adjacent to release lever lug on plate in counter-clockwise direction) so that flanged edge of baffle fits depressions in pressure plate at base of each lug and baffle is retained by springs when installed (spring seat on baffle plate ears). See that baffle plate ears are flat on spring seat ribs and that baffle seats fully in machined recess in plate (straighten baffle ears if bent by handling).

Model 11A6 Clutch—Install baffle in same manner as above except that baffle ears must be seated on spring seats adjacent to lugs in clockwise direction.

Release Lever Adjustment (On Borg-Warner Universal Clutch Fixture UF-300):—Except when rebuilding clutches, lever adjustment should not be changed unless levers are out of parallel more than .030". Place clutch on fixture with special lands under pressure plate lever lugs (all models with 3 levers, on models with 4 levers space lands equally). Set adjusting arm on sleeve so that height of lower face of arm above bottom of sleeve is correct for each model (see table below), install indicating plate on levers (except as noted), adjust each lever so that it just contacts indicating plate or adjusting arm, lock lever adjustment by peening nut into slot of adjusting screw (slotted screws), or against two flats on screw.

Lever Settings

Clutch Model & No.	Lever Height
8A7 —925, 959	2⅛"
9A7 —924	See Note
9A7 —943, 952, 953, 955	2 3/16"
10A6—939	2 3/16"
10A7—927	See Note
10A7—928, 940, 950, 957	2 5/32"
11A6—931, 941	2¼"

9A7, 10A7 Note—These models have 'duck-bill' type release levers and must be adjusted in special manner (longer length of levers makes it impossible to install height sleeve on fixture). With clutch installed on fixture, place special extension sleeve '3Z' on spindle (this sleeve correct height for lever adjustment), place indicating plate on levers with counterbored side up. Set adjusting arm flush with bottom of calibrated adjusting sleeve, install sleeve on spindle and adjust release levers in usual manner.

Release Lever Adjustment (Chrysler, De Soto, Dodge, Plymouth Models—Using Chrysler Clutch Fixture C-411 (Old Type)—Use same C-411-37A gauge set used on 1940 cars ('Y' shaped extension gauge and double ended 'C' and 'D' feeler gauge) and new 'E' feeler gauge No. C-411-40 (for Chrysler C28, De Soto, Dodge cars with Fluid Drive on which clutches do not have baffle plate). Install 'Y' extension gauge directly over release lever, tighten extension gauge locknut. Use correct feeler gauge (see table below), turn release lever adjusting screw nut until feeler is just snug between lever tip and extension gauge, lock adjusting nut by peening nut into adjusting screw slot or against screw flats. Check levers for uniform setting after completing adjustment.

New Type Clutch Fixture C-585—On this new fixture, feeler gauges are located in base of fixture under clutch assembly. Install clutch assembly on fixture with release levers directly above feeler gauges (on 4-lever type 11" clutches, install clutch with two levers directly over two of the feeler gauges, adjust these levers, then rotate clutch so that other levers are over feelers and adjust these levers). Place correct spacer on center screw of fixture (see table below), install compression plate on center screw making certain that it rests directly against all release fingers (plate can be reversed to provide proper clearance on all models), install self-aligning washer, plain washer, and compression nut. Tighten compression nut until clutch fully compressed, install clutch housing clamps over cover bolt holes and tighten clamps securely. Adjust each release lever adjusting nut until slight drag secured on each feeler (all feelers alike), lock adjusting nuts and recheck adjustment.

Chrysler Clutch Fixture— Car Model	C-411 Feeler	C-585 Spacer
Chysler C28, De Soto, Dodge Std.	'D'	#21
Above models with Fluid Drive	'E'	#20
Chrysler, De Soto, Dodge Taxicab	'C'	#19
Chrysler C30, C33	'D'	#21
Plymouth Std.	'D'	#21
Plymouth Taxicab (11A6)	'C'	#19
Plymouth Taxicab (10A7)	'D'	#21

Release Lever Adjustment (Without Fixture)—Types with Borglite Driven Member:—Use special gauge plate, Borg-Warner #4234 (see note on car manufacturer's gauge nos. below), and install clutch on flywheel with gauge plate in place of regular driven member with machined lugs on gauge directly under release levers on 3 lever types (on 4 lever types, place lugs in any position). Use short straightedge placed on edge on gauge plate hub and adjust release lever adjusting screw nuts until levers just contact edge of straightedge for all models marked 'flush' in table below (if lever setting marked 'high', a cut-out or step must be made in the edge of the straightedge at one end so that levers can be set higher than hub; if lever setting marked 'low', recess or step should be cut in straightedge at gauge hub so that end of straightedge extends below hub), lock adjustment by peening nut into screw slot or against flat on screw.

Clutch Model	Lever Settings	Lever Height
8A7 (Without Baffle)		3/16" Low
9A7 (Except Oldsmobile)		1/16" Low
9A7 (Oldsmobile)		Flush
10A6, 10A7		Flush
11A6 (With Baffle)		1/16" High

Gauge Part No. Note—Gauge plates furnished by car manufacturers as follows: Nash—J-1507 (levers set 3/16" below top of hub on 4140, flush with top of hub on 4160, 4180), Oldsmobile—J-1048.

Release Lever Adjustment (Without Fixture)—Types with standard driven member (not Borglite):—The #4234 gauge plate can be used on these models and levers should be set as shown in table below (adjust levers in same manner as directed above for types with Borglite Driven Member).

Lever Settings

Clutch	No Baffle—Lever Height	With Baffle
8A7	3/16" Low	
9A6	Flush	1/16" High
9A7 (exc. Olds)	⅛" High	
10A6	⅛" High	
10A7 (exc. Olds)	⅛" High	3/16" High
11A6 (See Note)	3/16" High	¼" High

NOTE—Model 11A6 Nos. 908 & 910 were set ¼" High (Without Baffle).

Driven Member (Borglite Type):—New type composite plate consisting of a small diameter disc with separate clock-spring type cushion segments (to which facings are riveted) riveted to outer rim. Segments are dished to provide soft engagement. This type of construction results in less weight at rim of driven member (which reduces spinning and allows quiet, fast gear shifting) without loss of strength in plate. Plate is balanced by additional rivets placed at rim of disc. Facings are riveted individually on cushion segments by one or two rivets in each segment. **Manufacturer recommends that driven member not be relined and that replacement driven member (with new facings installed) be used.**

Driven Member (Other Types)—Same as used on previous models with separate cushioning springs or spring tabs on plate. See Borg & Beck Clutch article in manual for data on these types.

LONG MODEL 11CFS SPECIAL TYPE

MODEL 11CFS-CI

PACKARD SIX TAXICAB, MODEL T1900 (1941)
PACKARD SUPER 8, '160' 1903, 3A, 4, 5 (1941)
PACKARD CUSTOM SUPER 8, '180' 1906, 7, 8 (1941)

IMPORTANT NOTE:—This model has special riveted construction and cannot be dismantled.

PRODUCTION CHANGE NOTE:—Long Model 11CF-CI used on late cars in production and this model also available as optional replacement on cars and Taxicabs with the 11CFS-CI clutch. See Long 'CF' Clutch article on following page for data.

DESCRIPTION:—Same design as other Long 'CF' type semi-centrifugal clutches except for added spring segments as follows:

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Spring Segments—Consists of three flat springs located between release levers. Springs are riveted to pressure plate at inner end and on clutch cover flange at outer end so that all clutch parts are permanently joined in one assembly (one clutch spring of each group extends through clearance hole in each spring segment).

SERVICING:—Cover assembly cannot be dismantled and is serviced on exchanged basis (spring segments must be removed first and will be damaged if any attempt made to remove clutch cover).
WARNING—Clutch will not operate satisfactorily with spring segments removed.

DRIVEN MEMBER:—Long 'CF' type. See Long 'CF' clutch article in Mechanical Equipment Section of manual for driven member data.

LONG 9CF, 9½CF, 10CF, 11CF MODELS

MODEL 9CF-CS
FORD '85', 11A,C PASS. CARS & COMM'L. (1941)

PACKARD SUPER 8, 1903,3A,4,5,6,7,8 (LATE '41)
MODEL 11CF-10½TI
CADILLAC, SERIES 41-60S, 61, 62, 63 (1941)
MODEL 11CF-TI
CADILLAC, SERIES 41-67, 75 (1941)
CADILLAC, COMM'L. SERIES 41-62, 75 (1941)

NOTE:—Cadillac Models—This clutch used only on cars with Std. Transmission. Cars with Optl. Hydra-matic Drive do not have any clutch.

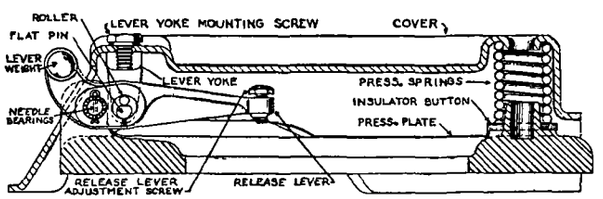
Packard Taxicab & Super Eight—This 11CF-CI clutch used in late production and as optional replacement for 11CFS-CI clutch used on first cars. See preceding article for 11CFS-C1 data.

Long Driven Members (On other cars)—Long driven members used with clutches of other makes on the following car models:

Car Model	Long Driven Member
Buick 41-40, 40A, 50	10CF-TS
Buick 41-60, 70, 90	10½CF-TI
Pontiac 6, 41-24, 25, 26	9CF-TS
Pontiac 8, 41-27, 28, 29	9½CF-TS
Pontiac Taxicab	10CF-CS
Studebaker Pres. 7C	9½CF-CS

NOTE—Borg & Beck 'Borglite' type Driven Members also used on Buick models.

SPECIAL SERVICE NOTES:—Cadillac Clutch Squeaks—To correct squeaks in clutch mechanism, apply thin coat of water pump grease to pressure plate driving lugs at point where they contact cover (apply by coating feeler gauge with grease and inserting feeler between lug and edge of slot). If release bearing squeaks, remove flywheel housing pan, turn clutch until grease plug is down, replace plug with lubrication fitting and lubricate bearing with wheel bearing grease. CAUTION—Do not over-lubricate bearing and make certain that fitting removed and plug re-installed.



Cadillac Service Clutches—Clutches furnished for service have locking pin or block at each release lever. **These blocks must be removed** after clutch installed on flywheel (blocks may drop down in housing and cause damage when engine operated).

Cadillac Clutch Balancing—See Cadillac Shop Notes in 'M' section for balancing instructions after clutch installed on flywheel.

TYPE:—Semi-centrifugal, single plate, dry disc type. Same design as used on corresponding 1940 car models.

SERVICING:—Mark all parts before dismantling and reassemble in same position. Replace grooved, warped, or checked pressure plates. Replace springs when pressure plate discolored from heat (see Spring Testing below).

Dismantling:—Place clutch on fixture (supporting pressure plate on special lands under lugs) or arbor press. Compress cover plate slightly, take out assembly screws (lever yoke mounting screws) on cover, release pressure on cover plate slowly, lift off plate. Note whether washers used on yokes under assembly screws (these washers must be reinstalled if old pressure plate used again). See special directions below on removing and reinstalling release levers. Remove and test clutch springs.

Release Lever Assembly:—Mount lever yoke on release lever, fasten by inserting flat-sided lever pin (flat side out or toward cover) and roller (place roller on flat side of pin). Insert lever in pressure plate lug, use roller pin sawed off to length of lever width as a guide and insert needle bearings, insert roller pin, pushing guide pin out, lock both lever pins with cotter pins. Thread release lever adjusting screws in ends of levers, turning screws down completely.

Assembling:—Place pressure plate on fixture or arbor press. Assemble pressure springs, locator washers or insulator washers on plate, place washers on lever yokes (if washers used previously and old pressure plate being used). Place cover plate in position (lining up marks made before dismantling), compress cover slowly guiding lever weights through holes in cover and lining up yokes under cover plate holes. See that pressure springs are seated, insert cover screws in yokes, using lockwasher under screw head, tighten screws down securely. Compress and release clutch several times (using weight on release levers) to seat all parts. Then adjust release lever heights.

Pressure Plate Servicing:—Regrinding or resurfacing pressure plate will throw levers out of adjustment and this must be compensated for by installing washers between lever yoke and clutch cover. Manufacturer recommends that when .020" removed from plate, washer thickness of .015" be used (washers should be approximately same size as end of lever yoke). CAUTION—If washers are found installed at this point when clutch is disassembled, make certain that these washers re-installed when clutch is assembled (if old pressure plate re-used), or discarded (if new pressure plate installed).

Clutch Springs:—Springs should check with table below. NOTE—Number shown thus (9) indicates number of springs used on each model.

Clutch Springs

Car Model	Spring Part No.
Cadillac (exc. Comm'l.)	C-2686 (9)
Cadillac 62, 75 Comm'l.	C-4188 (9)
Ford (9CF)	C-4873 (6)
Ford (11CF—BL1440)	C-1965 (9)
Ford (11CF—BL1478)	C-4873 (9)
Lincoln	C-2096 (9)
Mercury	C-5333 (9)
Packard (9½CF)	C-4905 (6)
Packard (10CF)	C-2096 (9)
Packard (11CF—Taxicab)	C-4873 (9)
Packard (11CF—Super 8)	C-4905 (9)

Spring Specifications

Spring Number	Pressure @1 9/16"	No. of Coils	Color Marking
C1965	90-100 lbs.	8¾	Green
C2045	110-120 lbs.	8¾	Lgt. Green
C2096	125-130 lbs.	8½	Red
C2686	145-150 lbs.	8¾	Yellow
C4873	145-153 lbs.	8¼	Brown
C4188	170-180 lbs.	7.4	Plain or Orange
C5333	125-135 lbs.	8¾	Blue

Release Lever Adjustment (On Borg-Warner Universal Clutch Fixture UF-300):—Install special lands on fixture under pressure plate, set lever adjusting arm on sleeve so that distance from bottom end of sleeve to bottom of arm is correct for each model (allowable variation plus or minus 1/32") as given in table below. Adjust levers by turning lever adjusting screw in each lever tip in or out, lock adjustment by peening lever into slot on screw.
CAUTION—Support screw on metal surface when peening lever to prevent distorting lever and screw.

Release Lever Settings

Clutch Model	Lever Height
9CF (all)	2 3/32"
9½CF (all)	2"
10CF (Lincoln)	2"
10CF (Mercury)	1¾"
10CF (Packard)	2⅛"
11CF (Cadillac)	1⅞"
11CF (Ford Truck)	2 7/32"
11CF (Packard)	2 7/32"

Above settings are plus or minus 1/32".

Release Lever Adjustment (without Fixture):—When using dial indicator to set release levers, on Model 9½CF install special Borg-Warner indicating plate on levers and lever setting should be 2½" plus or minus 1/32" with this plate in place. On other models this indicating plate is not used and lever settings are same as above. Lever heights must be equal within .005".

Cadillac Models—Manufacturer recommends that adjusting gauge J-285-C be installed on flywheel in place of regular driven member and short straight-edge used as guide on gauge boss. Release lever mounting clevis screw heads should be bumped lightly with 8 oz. hammer to bend cover slightly until lever tips contact edge of straightedge.

DRIVEN MEMBER:—Manufacturer recommends that driven member not be relined and that replacement driven member (with new facings installed) be used. See Car Model 'M' Page for facing specifications.

INLAND MODELS

Used On:

PONTIAC SIX, 41-24, 25, 26 (1941)
PONTIAC EIGHT, 41-27, 28, 29 (1941)
PONTIAC, TAXICAB MODELS (1941)
STUDEBAKER PRESIDENT, MODEL 7C (1941)

SPECIAL SERVICE NOTES:—Pontiac (Except Taxicab)—Pressure plate is permanently assembled as part of cover assembly with four shallow 'U' shaped segments of flat spring steel riveted to pressure plate at center and to clutch cover flange at ends. These spring segments replace the driving lugs and separate retracting springs used on previous models. CAUTION—Do not remove pressure plate or disturb spring segments. Clutch cover and pressure plate are serviced as an assembly (parts not furnished separately).

Pontiac Taxicab—This model has flat anti-rattle spring assembled in one of clutch cover holes adjacent to driving lug which is marked 'O'. Anti-rattle spring should be wired in place before clutch is disassembled (balance will be destroyed if spring assembled in any other cover hole).

Studebaker Service Clutches—Clutches furnished for service have spacers installed at each pressure plate driving lug. These spacers must be removed after clutch has been installed on engine.

DESCRIPTION:—Single plate type with diaphragm spring disc. Same design as used on corresponding 1940 car models except for new flat retracting spring and riveted assembly on Pontiac models (see Special Service Note above for description).

SERVICING:—Pontiac Note—Clutch used on all models except Taxicab cannot be disassembled and is serviced as an assembly. Disassembly data given below applies only to Pontiac Taxicab and Studebaker clutches.

Caution—Do not allow pressure plate to hang on retracting springs in clutch cover. When handling clutch cover assembly, support pressure plate by hand or invert assembly so that pressure plate is up.

Disassembly. On Pontiac Taxicab, wire anti-rattle spring (flat tension spring in hole on side of clutch cover adjacent to balance marked pressure plate lug slot) to cover so that it will be retained when pressure plate is removed—**shifting spring to any other position will upset clutch balance.** Working through holes in clutch cover, take out retracting spring mounting screws, withdraw three retracting springs, lift pressure plate out. This completes disassembly (cover, diaphragm, and release bearing plate serviced as an assembly only and should not be dismantled).

Assembly. Place cover and diaphragm assembly over pressure plate making certain that pressure plate lug marked '0' is engaged in cover slot which is similarly marked (mark on cover will be found on mounting flange below slot), install retracting springs and tighten mounting screws. On Pontiac Taxicab, make certain that anti-rattle spring is in place in cover in hole adjacent to balance-marked slot and that it bears on pressure plate edge. No release lever setting, etc., required.

NOTE—Manufacturer recommends that new retracting springs be used with clutch whenever a new or relined driven member is installed.

DRIVEN MEMBER:—Long 'CF' type driven members used on all models. See Long 'CF' type Clutch article for driven member data.

TROUBLE SHOOTING:—Clutch Poor Release Complaints—On Pontiac Taxicab, faulty release of clutch caused by anti-rattle spring wearing into plate and binding at end of spring. To correct this condition, examine pressure plate and spring for indication of interference. Smooth up pressure plate to provide good bearing surface for face of spring. See that spring does not have end thrust on pressure plate lug (shorten end of spring if necessary). Lubricate spring with Lubriplate when reassembling. CAUTION—Driving lug slots must not be widened to correct poor release. Clearance in excess of .005" at either side of lug will cause clutch noise and roughness. When installing clutch, make certain that dowel in flywheel engages hole in cover (cover will be distorted and clutch out-of-balance result from installation in any other position).

Clutch Release Noises (Pontiac)—If clucking noise noted when pedal depressed to release clutch, examine felts at each end of clutch control countershaft (clutch linkage cross-shaft) and lubricate if dry. IMPORTANT—These felts should be lubricated at regular lubrication periods. Refer to 'Clutch Pedal Rattle Correction' for 1940 models in 1941 Pontiac Shop Notes in 'M' Section.

Intermittent Buzzing (Pontiac)—A buzzing noise at about 28 MPH. which is not continuous may be caused by loose dampener spring in clutch driven member hub.

ROCKFORD MODELS

Assembly Number	Used On: MODEL 8½SP

UCLA-3-1748—BANTAM, SUPER FOUR MODEL 65 ('41)

SPECIAL SERVICE NOTE:—Facing Installation—Front facing is free and floats between driven disc and flywheel. Rear facing is riveted to pressure plate (driven member is unlined).

DESCRIPTION:—Single plate, dry disc type. Same design as used on corresponding 1940 model. Clutch release levers are built with a fulcrum lug which engages cover and are linked to studs inserted through pressure plate (facing riveted on face of pressure plate and must be removed to remove these studs). Twelve short springs (¾" working height) are mounted in pockets in pressure plate and cover.

SERVICING:—Pressure plate assembly need not be dismantled when replacing driven member unless pressure springs are to be tested or replaced or other service work performed.

Dismantling:—Place cover assembly in arbor press with pressure plate down, compress cover slightly, remove cotter pins, lever pins, unhook lever springs, remove levers, release pressure slowly, lift off cover.

Clutch Springs:—Check springs and replace if weak or burnt. Springs should check with following figures:

Spring Specifications

Car Model	Spring Pressure & Height
Bantam	23-27 lbs. at ¾"

Assembling:—Place pressure plate and release lever stud assembly on arbor press or clutch fixture (studs must be installed before facing riveted on pressure plate). Install clutch springs (12 used), install cover plate with lever studs extending through plate. With release lever springs in place, install levers and insert lever pins.

Release Lever Adjustment:—Levers not adjustable but lever tips should be exactly 1" above outer surface of facing on pressure plate (check with facing installed). Clearance between lever tips and face of release bearing should be 1/16" with clutch engaged.

DRIVEN MEMBER:—Driven plate consists of an unlined steel disc. Rear facing is riveted to face of pressure plate, front facing floats between driven member and flywheel. See car model 'M' page for facing specifications.

ROCKFORD (CROSLEY) TYPE

Used On:

CROSLEY, MODEL CB41 (1941)

DESCRIPTION:—Single plate dry disc type. Clutch assembly consists of three fulcrum brackets (mounting brackets) which are bolted individually on the flywheel. Release levers are pivoted on pins in fulcrum brackets and engage lugs on pressure plate with pressure spring mounted on pressure plate under each lever (3 springs used).

SERVICING:—Disassembly. Take out cotter pin and remove pin linking release lever to fulcrum bracket, remove release lever and spring. Repeat this operation at each of the three fulcrum brackets.

Assembly—Install fulcrum bracket on pressure plate lug, install spring, place release lever in position with hole in lever and fulcrum bracket lined up, install pin and secure with cotter pin.

DRIVEN MEMBER:—Consists of a steel disc with slotted rim on which linings are riveted in four separate segments. Each lining segment retained by three rivets with rivet heads reversed on alternate segments (rivet heads toward flywheel on adjacent segments).

Servicing—Facings not furnished separately and driven member should be serviced by replacement.

BUICK 40, 50 (OWN MAKE)

Used On:

BUICK, SPECIAL SERIES 41-40, 40A (1941)
BUICK, SUPER SERIES 41-50 (1941)

SPECIAL SERVICE NOTE:—Both Borg & Beck 'Borglite' and Long 'CF' type driven members used on these cars. Both types have woven facings which are grooved for quicker release. Driven members are balanced by installation of extra rivets or clips on driven member hub and these balance weights should not be removed. Driven members should be installed with large oil baffle toward transmission. Driven members are serviced as an assembly (parts not furnished separately).

TYPE:—Single plate, dry disc, 'Crown Spring' type. Same design as used on corresponding 1940 cars.

SERVICING:—Mark pressure plate, spring disc and cover before disassembling clutch to insure reassembling in same positions (do not prick-punch spring disc, use paint or chalk for marking).

Disassembly. Use special tools J-1039-1 and J-1039-2 to unhook retainer springs from clutch cover ears working springs slightly toward center to permit tool engagement (do not hammer on tool which will distort cover), lift clutch cover off. Unhook retainer springs from spring disc by working one leg of each spring in through pressure plate lug toward center of clutch and other leg out, lift off spring disc, remove retainer springs from pressure plate lugs.

Assembly. Intall retainer springs in pressure plate lugs with curved legs of springs up toward spring disc (push one leg of each spring in toward center of clutch and other leg out so that it is just entered in hole in lug). Apply 'Lubriplate' lightly on spring disc at points where it contacts pressure plate and retainer springs (excess will ruin clutch facings), place spring disc on pressure plate, maneuver retainer spring loops over disc by turning springs so that they are properly aligned. Install cover, use special tools to engage retainer spring loops on cover ears. Make certain that marks on pressure plate, spring disc, and cover are lined up. This completes clutch assembly (no release lever adjustment, etc., required).

DRIVEN MEMBER:—Borg & Beck 'Borglite' or Long 'CF' type (both used). See Special Service Note (above) and separate articles on Borg & Beck and Long 'CF' type clutches for driven member data.

BUICK 60, 70, 90 (OWN MAKE)

Used On:

BUICK, SPECIAL SERIES 41-60 (1941)
BUICK, ROADMASTER SERIES 41-70 (1941)
BUICK, LIMITED SERIES 41-90 (1941)

SPECIAL SERVICE NOTE:—Both Borg & Beck 'Borglite' and Long 'CF' type driven members used on these cars. Both types have woven facings which are grooved for quicker release. Driven members are balanced by installation of extra rivets or clips on driven member hub and these balance weights should not be removed. Driven members should be installed with large oil baffle toward transmission. Driven members are serviced as an assembly (parts not furnished separately).

TYPE:—Single plate, dry disc type. Same design as type used on corresponding 1940 car models.

SERVICING:—Mark all parts before dismantling and reassemble in same relative positions to maintain balance.

Disassembly:—Place cover assembly on flat surface or arbor press so that it is supported on pressure plate only, place block on cover so that it clears release levers, compress cover sufficiently to relieve tension on adjusting nuts, remove nuts, release pressure slowly. Lift off cover. This will expose all parts for servicing and inspection. Replace all worn parts, check clutch springs.

Clutch Springs:—Check springs and replace if weak or burned. Twelve springs used (installed in groups of two between each release lever and adjacent pressure plate driving lug).

Spring Pressure	Length
144 lbs.	1¾"

Assembling:—Place pressure plate on flat surface (use support under plate only). Install pressure springs on plate, place cover in position on springs lining up marks on cover and pressure plate. Compress cover slowly, making certain that driving lugs on plate enter slots in cover, and use tool J-857 to line up lever pivot screws with hole in cover, install adjusting nuts on screws, adjust lever heights as directed below.

Release Lever Adjustment:—Assemble special gauge plate, No. J-1036, in flywheel in place of driven member, tighten all cover mounting screws evenly and securely. Mount dial indicator and service tool J-1013 on clutch, adjust each release lever by turning nut on adjusting screw so that dial indicator reads zero (lever tip height equal to top of hub on gauge plate) and all levers are equal within .005". Lock adjustment by crimping nut flange against flat on adjusting screw.

DRIVEN MEMBER:—Borg & Beck 'Borglite' or Long 'CF' type (both used). See Special Service Note above and separate articles on Borg & Beck and Long 'CF' type clutches for driven member data.

CHEVROLET (OWN MAKE)

Used On:

MASTER DELUXE AG, SPECIAL DELUXE AH ('41)
ALL COMMERCIAL & TRUCK MODELS (1941)

NOTE:—Clutch is same as 1940 type in that Clutch Cover, Diaphragm Spring, and Pivot Rings are riveted together in a permanent assembly. This assembly cannot be dismantled and parts are not furnished separately (furnished as an assembly only).

SPECIAL SERVICE NOTES:—1941 Driven Member—Pass. Cars. New type driven member disc used has heavier (.024") clock spring facing cushions which have a maximum drag release of .070" (.058" on 1940 model) for deeper cushioning action and improved engagement. **This new 1941 type driven member must not be installed on previous models.** If used on previous models, driven member would not release properly and resulting drag would cause gear clashing.

Clutch Balance Marks—When installing pressure plate make certain that '0' marks on one lug of plate and on clutch cover flange are lined up. When installing clutch in engine, line up 'X' marks on clutch cover and flywheel. This is necessary to maintain clutch balance.

Clutch Rattles at idling speed (released)—Can be corrected by renewing retracting spring without removing clutch from engine by removing clutch housing underpan and turning flywheel until retracting springs are at the bottom (3 springs used). Remove spring bolt, withdraw spring, install new spring in same manner. Renew all three springs in same way. If new springs do not correct rattles, check clearance between pressure plate lugs and edge of clutch cover slot. Clearance should be .002-.008" and clutch cover assembly or pressure plate should be replaced if clearance exceeds .010".

Clutch Fork Installation—If retainer in groove in fork is worn, install new retainer being certain that high side of retainer is up (away from bottom of ball opening), and open end of retainer on the horizontal.

TYPE:—Single, plate, dry disc, diaphragm spring type. Same design as used on previous models except for new type driven member (see Special Service Note above).

SERVICING:—Disassembly Note—Diaphragm disc, clutch cover, and pivot rings are permanently assembled as a riveted unit and cannot be dismantled. Disassembly is limited to removal of pressure plate as described below.

Disassembly:—Take out screw in each retracting spring (3 used), working through holes in clutch cover, remove springs, lift cover assembly off pressure plate. Cover assembly cannot be dismantled further (diaphragm disc and cover riveted together).

CAUTION—Do not allow pressure plate to hang on retracting springs in cover. Always support pressure plate by hand when lifting clutch assembly.

Servicing:—Wash all parts except throw-out bearing is gasoline (see Caution below), examine pressure plate and flywheel face for scored or rough surface, check pressure plate drive lugs for burrs, see that lugs move freely in cover slots and that clearance in slots is .002-.008" (replace pressure plate or cover if clearance exceeds .010").

Check diaphragm spring and pivot rings for distortion or cracks. See that throw-out bearing is not rough and moves freely on clutch shaft sleeves, check transmission pilot hole in housing for run-out (must be less than .008"). Check clutch fork ball seat and ball fit, check driven disc and clutch shaft splines (replace disc if splines worn).

CAUTION—Throw-out bearing permanently lubricated and must not be soaked in gasoline which may dissolve lubricant on balls.

DRIVEN MEMBER:—Two types used—9⅛" diameter on Pass. Cars & ½ Ton, 10¾" on all other trucks. To install new facings, drill old rivets out from head side. Use riveting fixture to install new facings (fixture will flatten rivets exact correct amount of 7/32"), and reverse rivets in pairs (two each way). Facings are grooved type.

CAUTION—Passenger Car 1941 type Driven Member must not be used on previous models (will not disengage properly). See special service note above for description of new driven member.

HUDSON (OWN MAKE)

Used On:

HUDSON, ALL MODELS (1941)—SEE NOTE

NOTE:—Two clutch types (9" and 10") used on 1941 models as listed below. Special combinations of inner and outer clutch springs are used on the different models (see Clutch Spring data below) and two types of driven members are used (see Driven Member data).

Model	Clutch Size
10, 11 (No Overdrive)	9"
10, 11 (With Overdrive)	10"
12, 14, 15, 17, 18	10"

DESCRIPTION:—Single plate, cork insert type, operating in oil. Same design as used on previous models.

SERVICING:—Clutch assembly need not be dismantled when replacing driven member unless springs are to be tested or replaced, pressure plate replaced, or other service work performed.

Dismantling:—Check punch marks near outer edge of pressure plate in line with mark on cover flange or make new marks to insure reassembly in same position. Place clutch assembly on special clutch fixture (#J-298-H) or in arbor press supporting pressure plate so that cover is free. Compress cover slightly, take off 3 nuts on clutch finger retainer bolts on cover, release pressure slowly, lift cover off.

Pressure Plate:—Examine plate, replace if scored. Check for warping (particularly if plate 'blued' due to overheating). Replace if warped more than .010".

Clutch Springs:—Outer and inner springs (inner springs on some models only) should be checked with tool U15. If spring pressure does not check with specifications shown below, or if pressure plate is blued indicating overheating, springs should be replaced.

Car Model	Outer—Springs—Inner No.	Part No.	No.	Part No.
10 Std.	9	45148	3	155224
10L, 11 Std.	9	45158	6	155224
12 Std.	12	45149		
18 Std.	12	45148		
10, 11, 12, 18 (Overdrive)	12	45149	3	155224
14, 15, 17 Std. & Overdrive	12	45149	3	155224

NOTE—Model 10L has large (3x5") engine.

Spring Specifications

Spring Part No.	Pressure & Length
45148	155 lbs. at 1¾"①
45149	135 lbs. at 1⅝"①
155224	80 lbs. at 1⅝"①

①—Plus or minus 5 lbs.

Assembling:—Check clutch throw-out fingers, see that they are straight and do not show wear at tip or retainer lug. Replace retainer washers if necessary. Place pressure plate on fixture with face down. Assemble springs, clutch fingers, retainers and retainer washers on plate. Place cover on top of pressure plate assembly (lining up marks on cover and plate), compress cover slowly, guiding retainer bolts through holes in cover, install nuts on retainer bolts, tighten securely. Check clutch finger heights after clutch installed on flywheel.

INSTALLATION & ADJUSTMENT:—Shellac new gasket on face of cover flange, see that flywheel face smooth and clean, use clutch aligning arbor (#J-449) inserted through clutch cover and driven plate to align driven plate, mount clutch assembly on flywheel, install cover screws, tighten screws evenly and securely (draw down screws diametrically opposite together to avoid distorting cover). Then align clutch fingers.

Clutch Finger Alignment:—Use special clutch finger adjusting gauge (#J-774) resting gauge on clutch cover so that pin is directly above clutch finger tip. Turn thumbscrew down until pin contacts finger. Repeat at other clutch fingers to secure final gauge setting equal to lowest finger. Turn gauge to higher finger, strike end of retainer bolt with soft hammer until gauge bar rests squarely on cover hub. With final setting, gauge bar should rest squarely on hub over all fingers and clearance between pin and end of thumbscrew must be less than .005" (all fingers equal within this amount—check with feeler gauge).

Throw-out Bearing & Oil Seal:—Oil seal is pressed on collar behind throw-out bearing. When installing new oil seal, press firmly near inner diameter (pressure at point near rim may distort outer stamping and allow inner stamping and oil seal leather to revolve with shaft, this will cause noise similar to noisy throw-out bearing). Use arbor press to install throw-out bearing (do not drive on). See that bearing revolves smoothly and that oil seal inner stamping is tight in outer stamping before installing collar in clutch cover.

DRIVEN PLATE:—Driven plate has spring-dampener type hub and facing consisting of cork inserts. Examine driven member, see that plate runs true and is not warped or distorted, and that springs in hub do not have appreciable free play. See that hub splines are not worn and are free from burrs. Corks must be in good condition. Black glaze indicates use of wrong lubricant. Soak driven plate in Hudsonite and clean corks, or replace driven member.

Driven Member Specifications

Car Model	Outside Diam.	No. of Corks
10, 10L, 11 Std.	9"	90
10, 10L 11 Overdrive	10"	108
12, 18 Std. & Overdrive	10"	108
14, 15, 17 Std. & Overdrive	10"	108

BUICK TYPE

Used On:

BUICK SERIES 41-40, 40A, 50, 60, 70, 90 (1941)

TYPE:—Independent 'parallelogram' type with coil springs. Design same as used on 1940 Series 40, 50, 60, 70 (1940 Series 80, 90 type no longer used) with following features:

Lower Control Arms—Fabric bushings used at inner ends of lower control arms (frame connection). These bushings swaged on grooved shaft and lower control arms pressed on bushing and shaft assembly with .002-.007" press fit. Control arm, bracket shaft, and spring seat cannot be dismantled and serviced as an assembly only. Rubber seals are used on knuckle support bolt at outer end of control arm.

Upper Control Arm (Shock Absorber Assembly)—Interchangeable on right and left side of car (same as 1940). Caster adjustment located at rear of control arm (left side of car), front of arm (right side). Seals are not used on knuckle support eccentric pin at outer end of upper control arm.

CHECKING & ADJUSTMENT:—Before making adjustments, place front wheels in straight ahead position (measurement from center of tire tread to lower arm frame bracket shaft should be same on each side of car), and check following points:

Frame Height—Distance from lower face of frame cross-member to upper face of lower control arm should be 3⅝" (40,50,60,70), 4" (90) with regular springs and 4" (All Series with Optl. High Springs). If height not correct, or unequal by more than ¼", install shim on spring on lower side of car, or replace springs (see Spring data below).

Tire Inflation—Check tires and inflate to 25 lbs. (front), 30 lbs. (rear) **when tires are cold** or 27 lbs. (front), 34 lbs. (rear) **when tires are warm.**

King Pin Inclination—3½° (40,50,60,70 with 1⅛° Camber), 4¾° (90 with ⅞° Camber).

NOTE—Car weight must be on wheels when checking adjustments.

Caster:—Should be ⅜° ± ⅜° Positive (all cars). Machined bosses provided on ends of knuckle support for protractor mounting (use tool J-1521).

To Adjust—Jack up front wheels, loosen clamp bolt in upper end of knuckle support, remove lubrication fitting in end of upper support bushing (at front on right side of car, at rear on left side of car), insert Allen wrench through hole in bushing and turn upper support pin so as to move upper end of knuckle support to rear (to increase caster) to front (to decrease caster). One quarter turn of pin will change caster ¼°. Use care not to turn support pin beyond end of threads or bind knuckle support on upper control arm. Tighten clamp bolt and recheck with car weight on wheels.

Camber:—Negative ⅛° to Positive 1⅛° (40,50,60,70 with Std. Springs), Positive ⅛° to Positive 1⅜° (40, 50,60,70 with Optl. High Springs), Negative ⅜° to Positive ⅞° (90 with Std. Springs). Check camber by placing protractor (or tool J-1521) on machined end of bearing hub with dust cap and hub cap removed, or by measuring between center of tire tread at top and bottom of wheel. Top distance should be from 58 21/32" to 59 9/32" (40,50), 59 5/32" to 59 25/32" (60,70), 58½" to 59¼" (90). Bottom distance should be from 58 25/32" to 58 7/32" (40,50), 58 9/32" to 58 23/32" (60,70), 58⅞" to 58 5/16" (90). First figure is for Negative Camber (above), second figure for maximum Positive Camber (above).

To Adjust—No adjustment provided. Special eccentric upper support pin, Group 6.178, Part No. 231760, may be installed and will permit slight camber corrections (turning eccentric pin will increase or decrease camber).

Toe-In:—Should be 0-1/16" depending on average camber (half sum of camber for each wheel). To check toe-in, measure between outside of tire treads at rear, roll car ahead ½ revolution and measure between same points on tires at front.

To Adjust—Loosen clamp bolts and turn adjusting sleeve at outer end of each tie rod equally (turn wrench toward rear to lengthen rods to increase toe-in). Three-eighths turn of adjusting sleeve on each side of car will change toe-in ⅛".

Steering Geometry (Toe-out on Turns):—With outer wheel turned exactly 20°, inner wheel should be turned 22° ± ¾°. No adjustment provided.

SERVICING:—Lower Control Arm & Support Pin—Lower control arm cannot be dismantled and is serviced as an assembly. When assembling control arm on knuckle support, first place rubber seal over end of each arm, make certain that bushing tight in lower end of knuckle support with head toward rear, center knuckle support between control arms and thread lower support bolt through arms and bushing from front, install nut on rear end. Then pull rubber seals down over ends of arms and see that they seat on bolt between arm and end of knuckle support bushing.

Upper Control Arm—Both bushings threaded on upper support pin (rear bushing also threaded in control arm, front bushing plain type and locked by clamp bolt in control arm. Seals not used.

SPRINGS:—On all models, upper end of front spring has smaller end coil which pilots on cup attached to frame by shock absorber mounting bolts and end coil at lower end is not ground flat (must be fitted in recess in lower spring seat). All springs marked with part number on coil near end and are paint marked for identification. If spring length incorrect by more than ¼", install special spacer shim, No. 1310413 (⅛" thick), on top coil of spring (if spring too short), replace spring (if too long).

Standard Spring Specifications

Car Model	Part No.	Color Mark
41, 46, 46S, 49	1317791	Blue & Green
51, 51C	1317791	Blue & Green
56, 56S, 56C	1317791	Blue & Green
61, 66, 66S	1317792	Blue & White
71, 71C, 76S, 76C	1317792	Blue & White
Optl. High Springs		
41, 46, 46S	1314950	White
51, 51C	1314950	White
56, 56S, 56C	1314950	White
61	1315045	Green
66, 66S	1314950	White
71, 71C, 76S, 76C	1315045	Green

FRONT STABILIZER:—Consists of an anti-sway bar mounted on rubber bushings in stamped brackets on frame and linked to lower control arm by links which have rubber grommets at stabilizer arm and control arm. Stabilizer should not require servicing but if links disconnected or trouble experienced with frame bracket rubber bushings, service these parts as follows:

Stabilizer Bracket Bushings—If bushings pop out of place in brackets (usually caused by excessive soaping when installed), re-install bushings as follows: Remove stabilizer shaft and bracket assembly from car, break welds between brackets and back plates, clean outside of bushings with steam or gasoline to remove all traces of soap and grease, locate bushing on shaft in correct position, install bracket bushings, clamp brackets and back plates together in vise and wire together (need not be welded), install assembly on car and remove wires as bracket bolts are installed and tightened. To install new bushings, cut old bushings off, use weak soap sud and water solution to slide bushings over end of shaft (do not use strong soap or mineral lubricants).

Stabilizer Links—When installing links, install link rod with nut at lower (control arm) end with spacer on rod between upper and lower grommet assemblies, tighten nut to limit of threads and check over-all length of upper and lower grommet assemblies. If distance from outside of upper and lower grommet metal cups is not 1 11/16", adjust nut for correct dimension.

CADILLAC TYPE

Used On:

CADILLAC, SERIES 41-60S,61,62,63,67,75 (1941)

TYPE:—Independent 'parallelogram' type with coil springs. Design same as type used on 1940 Series (except Series 75 type which is not used). All models are similar and adjusted in same manner.

ADJUSTMENT:—Before making adjustments check wheels for balance, run-out, and tracking; check front wheel bearing adjustment, see that shock absorbers filled with fluid and operating properly, check steering gear adjustment, see that control arms operate freely and that control arm and knuckle support bushings are correctly installed. Place front wheels in straight ahead position and check following points first:

Tire Inflation—Check tires and inflate as follows: 41-60S,61,62,63—28 lbs. (front & rear), 41-67,75—24 lbs. (front), 32 lbs. (rear).

Wheel & Tire Run-Out—Check wheels for run-out and mark high point on tire. Place this mark vertically (at top of wheel) when checking Toe-in and Toe-out, horizontally (at one side of wheel) when checking Caster, Camber and Kingpin Inclination.

Kingpin Inclination—5°51' crosswise (All Series) with 0° Camber.

NOTE—Car weight must be on wheels when checking adjustments.

Caster:—Negative 1¾° to Negative 2¾° (All Series). Must be equal within ½° on both sides of car.

To Adjust (All Series)—Loosen the clampscrew in upper end of knuckle support, remove lubrication fitting in front bushing of upper control arm, insert Allen wrench, Tool J-720, through lubricant fitting hole, turn eccentric upper support pin **in complete turns only,** clockwise to increase caster, counter-clockwise to decrease caster. IMPORTANT—Camber will be disturbed unless pin turned in complete turns only.

Camber:—Positive ⅜° to Negative ⅜° and preferably 0° (All Series). Must be equal within ½° on both sides of car.

To Adjust (All Series)—Same as for the Caster Adjustment on these same cars (see Caster Adjustment above) except that entire range of adjustment secured in ½ turn of eccentric pin. Pin must not be turned more than ½ turn from point where correct caster secured or caster will be upset when this camber adjustment made.

Toe In:—Should be 1/32"-3/32" with car at rest (All Series). Measure with 'high point' of tire run-out in vertical position (at top of wheel).

To Adjust (All Series)—Loosen the clamp bolts and turn tie rod adjuster (at wheel end of each tie

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

rod) equally on both sides of car (to maintain correct position of steering gear).

Steering Geometry (Toe-out on turns):—With outer wheel turned exactly 20°, inner wheel should be turned exact amount shown in table below for right and left turns.

Car Model	Inner Wheel—Right Turn	Inner Wheel—Left Turn
41-60S,61,62,63	24°42′	25°25′
41-67, 75	23°6′	24°7′
41-62, 75 Comm'l.	23°6′	24°7′

SERVICING (ALL SERIES):—Lower Control Arm & Knuckle Support Pin—Control arm mounted on inner frame bracket shaft by threaded bushings (bushings threaded on shaft and in control arms) with rubber seals on shaft. Shaft can be removed from control arms after bushings have been removed. Support pin at outer end of control arm is threaded through both control arms and bushing in lower end of knuckle support and has nut on rear end. Rubber seal is installed on support pin at front end of bushing (between knuckle support and front control arm).

Upper Control Arm Support Pin—This eccentric pin is threaded in bushings in each upper control arm and in upper end of knuckle support (rear bushing is threaded type and is screwed in control arm, front bushing is plain type and is locked in control arm by clamp bolt). A clampscrew in the upper end of the knuckle support locks the pin in the support to maintain caster and camber setting.

SPRINGS:—Part number is stamped on end coil of each spring. When installing springs see that insulator at top and bottom of each spring.

NOTE—Frame height or spring height when installed on car should be 4½-5¼" (from top of lower spring seat to lower edge of frame side rail).

Spring Specifications

Car Model	Part No.	Color Mark
41-60S, 61, 63	1428431	None
41-62①	1428432	Green
41-62②	1428431	None
41-67, 75	1428433	Pink
41-62, 75 Comm'l.	1428429	Yellow

①—Before Engine Number 8340211.
②—After Engine Number 8340210.

CHEVROLET TYPE

Used On:

MASTER DELUXE AG, SPECIAL DELUXE AH ('41)

SPECIAL SERVICE NOTES:—Where excessive bumping occurs on cars operated on rough roads or heavy service, check front end to make certain that lower control arm rubber bumpers are in place and replace any missing bumpers. Install heavy duty shock absorber valves (see Delco Parallel Cylinder Shock Absorber article for data) and if these measures do not correct complaints, heavy duty front springs may be installed (see Spring data below).

TYPE:—Independent 'parallelogram' type with coil springs. Design same as type used on corresponding 1940 models except as follows:

Lower Control Arm—Spring seat now riveted to lower control arms (need not be dismantled for frame support shaft removal). Frame support shaft seals installed in grooves in shaft (separate metal retainers not used).

Springs—Free length increased ⅛" (to 14 1/16") to offset added weight of car.

CHECKING & ADJUSTMENT:—Check the following points first before checking or adjusting front suspension unit.

Tire Inflation—26 lbs. (front), 28 lbs. (rear).

Wheel Runout—Check and adjust front wheel bearings. Check wheel for tire and rim runout and eccentricity. Mark tire midway between high and low spots (mean point) and place this mark at top (vertically) when checking Camber, at side (horizontally) when checking Toe In.

Steering Gear & Connections—Check mounting bolts and tighten if necessary. Check tie rod ball and socket joints for excessive looseness.

Frame Height—Install special gauges at front and rear ends of car to level frame when checking. Front gauge has holes to engage lower control arm shaft (inner end) and pivot pin (outer end) to hold control arms rigid in correct position. Rear gauge clamps axle housing and frame so that clearance between top of axle housing and frame siderail is correct.

NOTE—Make all checks with car weight on wheels (curb weight—car ready for road but no load).

Kingpin Inclination:—4¾° plus or minus ½°.

Caster:—0° plus or minus ½°. Adjusted by turning knuckle support eccentric upper pivot pin (same adjustment as for camber—See Camber Adjustment).

Camber:—Neg. ¼° (Wheel tilts in at top) plus or minus ½°.

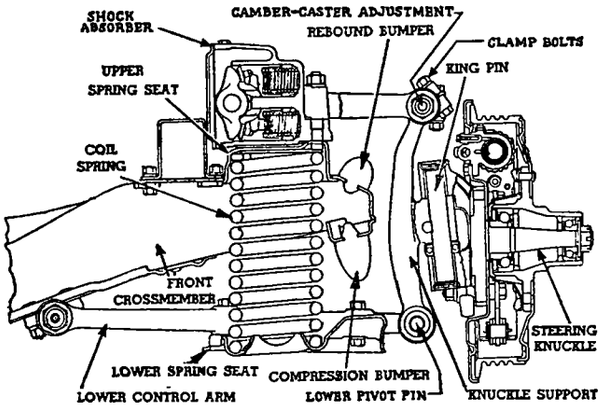
Adjustment—Remove lubricant fitting on knuckle support upper pivot pin front bushing, loosen clamp bolt in upper end of knuckle support which clamps pivot pin. Insert ¼" Allen wrench through lubricant fitting hole in bushing to engage pivot pin, turn pivot pin clockwise to increase caster, counter-clockwise to decrease caster (pin is eccentric and this same movement will change Camber from minimum to maximum every half turn of the pin) until both caster and camber are correct within limits given above, tighten clamp bolt and replace lubricant fitting. One half-turn of pivot pin will change caster angle 39′ and change camber angle from 0° to 1°2′ (depending on initial position of pin).

Toe In:—0" to 1/16". **Adjustment**—Loosen clamp bolts and turn left hand (short) tie rod. When tightening clamp bolts, make certain that both tie rod ends are in alignment with the ball studs.

NOTE—Right hand (long) tie rod is not adjustable.

Steering Geometry (Toe out on Turns)—Outer wheel turned in 20°, Inner wheel turned 24° plus or minus 2°. Not adjustable (replace steering arm).

SERVICING:—Suspension Unit Assembly Removal—Remove Front Fenders, Radiator, and Radiator Grille Assembly as a unit (see Chevrolet Shop Notes in 'M' Section for directions). Remove front bumper, disconnect stabilizer from frame horns, remove pitman arm from steering gear. Take out bolts holding front cross-member to frame side rails, slide suspension unit assembly off over frame side rails at forward end. Install in same manner.



Upper & Lower Control Arm Pivot Pins:—Serviced in same manner as on previous models. Neoprene seals used on each end of both upper and lower pivot pins.

Lower Control Arm Shaft:—To remove shaft, disconnect stabilizer link at lower spring seat, remove front spring, remove lower control arm pivot pin, remove lower control arm assembly by taking out bolts mounting shaft on cross-member. Place assembly in vise, remove front and rear control arm shaft bushings, maneuver shaft out of control arms (not necessary to disturb spring seat).

Assembly—Install new Neoprene seals on each end of shaft so that seals seat in recess at shoulder on shaft, install shaft in control arm assembly with letter 'F' (forged on one bracket) toward front of car. Hold shaft centered between control arms, screw front and rear bushings on shaft and in control arms, tighten bushings securely, install control arm assembly on car.

Front Stabilizer Shaft:—To remove, disconnect links by removing nut on upper end of link bolts and withdrawing bolts, then remove bolts from frame mounting brackets. To install stabilizer, make certain that steel spacer installed between frame and bracket, bolt bracket loosely to frame, install links, tighten bracket bolts only with links connected and car weight on wheels.

Stabilizer Links—Spacer must be installed on center of link bolt and steel retainer at outer end of bushings. Tighten link bolt nut to limit of threads.

SPRINGS:—Removal—Disconnect stabilizer link from lower spring seat, support weight of car on stand jack at inner side of lower spring seat, remove cotter pins and nuts from lower control arm shaft bracket bolts, drive out bolts and install long drift punch through bolt hole in bracket and cross-member to maintain alignment, raise car with chain hoist to remove spring pressure. Remove jack from beneath lower control arm allowing control arm and spring seat to drop down to free spring.

Assembly—Make certain that spring installed with ground end (flat surface) up and that lower end-coil of spring fits in recess in spring seat. Reverse removal directions given above.

SPRINGS:—Springs have end coil at upper end only ground flat. When installing springs, make certain that this flat end placed up and that end coil at lower end of spring is fitted in recess in lower spring seat.

Heavy Duty Springs—Use only for severe operation. Will prevent spring bottoming and provide more clearance at front end. Install 5245543 to correct severe bumping, 5246233 in extreme cases.

Spring Specifications

Part No.	Free Length	Deflection Rate	Car Hgt.
Production	14 1/16"	300 lbs.	Std.
3653059	13 15/16"	300 lbs.	Std.
5245543	13 13/32"	346 lbs.	Std.
5246233	13 9/16"	400 lbs.	1" Higher

Used On:
CHRYSLER, MODELS C28, C30, C33 (1941)
DE SOTO, MODEL S8 (1941)
DODGE, MODEL D19 (1941)
PLYMOUTH, MODELS P11, P12 (1941)

TYPE:—Independent 'parallelogram' type with coil springs. Design changed from type used on 1940 models as follows:

Upper Control Arm & Pivot Pin—Control arm is new design one piece type with forked outer end and separate pivot pin screwed in eyes in forked outer end of arm. New type eccentric bushing installed on pin within fork for steering knuckle support. See Control Arm service data below.

CHECKING & ADJUSTMENT:—Before making adjustments, check wheel and tire balance and run-out, front wheel bearing adjustment and king pin bushing clearance, steering gear adjustment, and shock absorbers. See that springs and shock absorbers in normal position (grasp bumper and work front end of car up and down several times). Then check following points first:

Frame Height—Use tool C-592 to measure distance from lower face of frame front cross-member lower plate (measure through hole in lower flange of frame side rail) to dimple on lower spring seat directly below this point. Distance should be 3⅜" (all models) and must be equal within ⅛" on both sides of car. If height not correct, install spacer on spring on low side (see Spring data below).

Tire Inflation—Check tires and inflate to 28 lbs. front and rear (except Chrysler C28, DeSoto, Dodge & Plymouth 7 Pass.—30 lbs. front and rear or 32 lbs. with larger 18" wheels).

Kingpin Inclination—4¾-6° crosswise (all models). NOTE—Car weight must be on wheels when checking adjustments.

Caster:—Negative 1° to Positive 1° (all models). Not adjustable. Controlled by distance knuckle support upper pivot pin bushing (eccentric camber adjustment) turned in on upper control arm. See Camber adjustment following.

Camber:—Positive ¼° preferred (0° to ¾° permissible) for all models. Correct kingpin inclination before adjusting camber.

NOTE—Special tool (narrow wrench designed to fit between knuckle support and upper control arm fork so as to engage eccentric bushing) must be used for Camber adjustment. This tool is No. C-611 (Chrysler C28, DeSoto, Dodge, Plymouth—except 7 Pass. models), C-619 (Chrysler C30, C33 and all other 7 Pass. models).

To Adjust—Loosen clampscrew in upper end of knuckle support, turn eccentric bushing in upper end of knuckle support not more than ½ revolution from place where correct caster is secured (bushing eccentric and entire range of adjustment secured in ½ turn). Bushing must not be turned so as to bind on upper control arm forks.

Toe-In:—1/16" preferred (0-⅛" permissible). To check toe-in, set wheels straight ahead, move car forward one full revolution of wheels. Measure between center of tire treads, hub high, at rear, then roll car forward ½ revolution and measure to same points on tires at front.

To Adjust—Loosen clamp bolts on each tie rod (long rod right side, short rod left side), turn tie rods equally. CAUTION—Make certain that steering gear turned so that roller on 'high' point of worm with wheels in straight ahead position after toe-in adjustment completed. Steering gear position can be corrected by shortening one tie rod and lengthening opposite rod equally.

SERVICING:—Steering Knuckle & Kingpin Bushings—To remove, remove wheel and hub, block brake pedal, remove nuts fastening brake support to steering knuckle, remove steering arm from knuckle, lift complete backing plate & brake shoe assembly off and hang up on frame (Caution—assembly must not be allowed to hang on flexible brake tube, on Chrysler Eights, brake tube must be disconnected before assembly can be removed and lines must be bled when reconnected). Drive out kingpin taper lockpin. Drive punch into kingpin upper oil seal disc and pry disc out. Use soft brass drift to drive kingpin down which will force out lower oil seal disc, remove knuckle. Pull upper bearing out toward bottom (use puller C-328—bushings used at this point on Dodge & Plymouth except 7 Pass.—all 7 Pass. models have roller bearing at top), pull lower bushing with same tool (roller bearing used at lower end on Chrysler C30, C33 only). Install new lower bushing and line-ream with special tool using pilot in place of upper bearing (on Dodge and Plymouth, install upper bushing from top and line up oil hole with oil hole in knuckle. Install all roller bearings with trademark facing out (up on top bearing, down on lower bearing) and see that oil hole lines up with oil hole in knuckle. Use new seals, install seals with convex side in toward kingpin and use tool C-618 to seat seals securely. On Chrysler C30, C33 only, seals should be staked or peened in place.

Upper Control Arm & Bushings:—New one piece type with forked outer end and separate pivot pin. Ordinarily serviced as complete assembly with frame mounting pivot bar (same design as 1940) but new pivot bar and bushings can be installed as follows: Use new bushings when installing pivot bar and use special spreader tool C-608 to maintain correct control arm spread while bushing being installed. Install spreader tool on inner ends of control arm so that jaws seat firmly against inner faces of control arm ends, expand tool until it is just snug in arm, then expand tool so that arms spread exactly 1/16" from the 'at rest' position. Install pivot bar (with seal on each end of bar) in control arm so that center line of rear frame mounting bolt holes is 1 5/16" to rear of line through center of fork on outer end of arm, start bushings on both ends of pivot bar, lubricate bushings with tapping compound or other suitable lubricant (bushings cut own threads), turn bushings in until shoulders contact surface of control arm, tighten bushings to 90-140 ft. lb. (45-70 lbs. on 24" lever). Check to see that pivot bar moves freely before installing control arm on car. CAUTION—Do not rotate pivot bar as this will result in incorrect position of bar in relation to arm.

Knuckle Support Upper Pivot Pin—Consists of a bolt threaded through both eyes of upper control arm from rear with nut on forward end. Seals are installed on pin at each side of eccentric bushing which is threaded on pin within control arm fork (bushing is clamped in upper end of knuckle support by clampscrew). With pin installed, over-all width of control arm fork (from front face of front eye to rear face of rear eye) should be 3⅛" and eccentric bushing should be centered in fork.

Lower Control Arm & Bushings:—Control arms and spring seat are riveted assembly. Bushings at inner end (frame connection) are self-threading type and new bushings should be used when a new control arm assembly is installed as follows:

Control Arm Shaft Bushings—Special tool C-594 must be used to maintain control arm alignment when bushings installed. Insert bracket shaft in control arm, install special tool so that it engages legs of control arm and studs on tool enter shaft mounting bolt holes, install nuts on studs and tighten securely. Tool will position arm correctly so that rear face of arm is 2 5/32" (Chrysler Six, DeSoto, Dodge, Plymouth except 7 Pass. Sedans), 2 7/32" (Chrysler Eights and all 7 Pass. Sedans) in back of rear shaft mounting bolt hole center-line. Start both bushings on shaft, use lubricant such as tapping compound and turn bushings in until bushing shoulders contact faces of control arms (bushings will cut own thread in control arm bosses), tighten bushings with 165 ft. lb. force. Remove tool and make certain that shaft pivots freely in arms.

Knuckle Support Lower Pivot Pin & Bushings—Pin should be inserted through rear arm and is locked by nut and cotter pin on forward arm. To assemble control arm and knuckle support, see that bushing installed in knuckle support with head toward rear, position knuckle support between control arms so that distance from rear face of support to rear face of support pin boss on rear arm is exactly 15/16" (Chrysler Six, DeSoto, Dodge, Plymouth except 7 Pass. Sedans), 1 1/32" (Chrysler Eights & all 7 Pass. Sedans). Thread support pin bushing, front rubber seal, and front arm. Install nut on forward end of pin and lock with cotter pin.

SPRINGS:—Springs used on Chrysler Six, DeSoto, Dodge, Plymouth (except 7 Pass. Sedans) do not have lower end coil ground flat and must be installed with spring end fitted into recess formed in lower spring seat (frame height will be incorrect if spring not properly installed). On Chrysler Eights and on all 7 Pass. Sedans, both ends of springs are ground flat and lower spring seat is also flat. When installing springs on all cars, see that silencer installed on lower end of all springs (in spring seat), and on upper end of spring (in seat in cross-member). If spacers used, these should be installed between upper end of spring and upper silencer.

①—When this spring installed to replace Std. Spring No. 857305 or 857306 (Chrysler), 857306 (DeSoto), following parts must be installed also: #691144 Lower Spring Silencer (2 used), #691144 Upper Spring Silencer (2 used), #633295 Spacer (driver's side only), #859665 Lower Control Arm Assembly (right), #859666 Lower Control Arm Assembly (left).

②—Including 4 door Sedans before Serial No. 30,345,250.

③—4 door Sedans only after Serial No. 30,345,250.

HUDSON TYPE

Used On:

SIX, MODELS 10, 11, 12, 18 (1941)

EIGHT, MODELS 14, 15, 17 (1941)

TYPE:—Independent 'parallelogram' type with coil springs. Design is same as used on 1940 cars.

CHECKING & ADJUSTMENT:—Before checking specifications and making adjustments, always perform the following operations first:

Wheels & Tires—Check wheels and tires for balance and runout, correct if required. Inflate all tires to correct pressure. Check front wheel bearings and adjust if loose. Runout must not exceed 1/16-3/32". mark 'high' point on tire and place this mark at top of tire (vertical) when checking toe-in, at front of tire (horizontal) when checking Camber and Caster.

Steering Linkage & Kingpin Looseness—Check kingpin bushings, drag link and connecting rod ends, and steering gear for looseness. Adjust steering gear and replace worn bushings and end joints.

Shock Absorbers—Check shock absorber action.

Frame Level and Spring Height—Level car by rocking car sideways (not endwise) several times and allowing it to come to rest. Check spring height at each side of car. If heights not equal within ½", replace or shim low spring (see Springs below).

NOTE—Car weight must be on wheels when checking following specifications.

Kingpin Inclination:—4°36' crosswise. Must be equal on both sides of car within ½°.
NOTE—Kingpin inclination affected by Camber Adjustment (decreases as Camber increased).

Camber:—Should be Pos. ¼° to Pos. ¾° and equal within ½° on both sides of car. NOTE—Toe-in setting depends on Camber and should be checked when Camber adjusted.

To Adjust—Adjusted by turning knuckle support upper eccentric pivot pin (Same as Caster Adjustment). See Caster Adjustment below and turn eccentric bushing not more than ½ turn from point where correct caster is secured.

Caster:—Should be 0° (plus or minus ¼°) and equal within ½° on both sides of car.

To Adjust—Loosen clamp bolt in upper end of knuckle support, turn eccentric bushing into support to increase caster, out of support to decrease caster. One complete turn of bushing will change caster ½°. Correct caster of 0° should be secured with center of knuckle support (clamp bolt center) exactly 1 11/32" ahead of face of upper support arm. After correct caster secured, turn bushing not more than ½ turn in either direction to adjust Camber (½ turn will give maximum camber adjustment of plus or minus ½°). Tighten clamp bolt.

Toe-In:—Should be 0-1/16" measured at wheel rim with wheels set straight ahead and intermediate steering arm centered by means of centering tool J-1442.

To Adjust—Loosen clamp bolts and turn both tie rods equally. NOTE—Tie rod lengths must be equal.

Steering Geometry:—With inner wheel turned 30°, outer wheel should be turned exactly 25°. Allowable variation ½°. No adjustment provided (if incorrect, check for bent steering arms).

SERVICING:—Spring Removal & Installation—To remove spring, support front of car on jack stand under inner side of lower support arm on side from which spring to be removed, remove shock absorber (see below), remove bolts from lower support arm inner pivot shaft bracket, raise car slowly and carefully until spring fully expanded. Install spring in same manner. Make certain that spring installed with flat end up and rubber-and-fibre silencer on upper end of spring, and see that lower end of spring properly seated in spring seat on lower support arm. Check spring height (see Springs below).

Shock Absorber Removal & Installation:—Remove retainer nut on upper mounting stud (on upper support arm frame bracket), remove washer and rubber bushing. Remove two screws holding shock absorber lower anchor plate on underside of spring seat on lower support arm, turn shock absorber ¼ turn, and lower through hole in spring seat, remove from below. Replace shock absorber in same manner.

Lower Support Arm:—When installing inner pivot shaft, use tool J-1052 to maintain exact distance of 11½" between inner faces of lower support arms while bushings are being installed. Distance from inner face of support arm to center-line of frame mounting bolt holes must be exactly 1½" for correct alignment. Make certain that seals installed on shaft so that end of seals extends over inner ends of bushings.

Upper Support Arm:—When installing frame mounting shaft bushings, use tool J-1360 installed on center stud of pivot shaft mounting, center arm in tool when bushing installed. See that seals installed on pivot shaft so that ends extend over ends of bushings. When installing knuckle support eccentric bushing, hold support 9/32" from shoulder on arm, screw into support and on arm until support is ⅞" from shoulder on arm. Check Caster & Camber.

SPRINGS:—Install springs with flat end up and silencer on upper end of spring. If spring height (measured from upper face of lower support arm to lower edge of upper rubber bumper support bracket) is not equal within ½" on each side of car, spring should be replaced (rock car sideways and allow it to come to rest naturally before checking heights). A maximum of 2 shims .120" thick may be installed on top of low spring to correct minor height differences (replace springs if more than 2 shims required).

Spring Specifications

Car Model	Part No.	Color Mark
10, 11, 12	162530	Brick Red
18	162531	Pink
14, 15, 17 (Right)	162532	Violet
14, 15, 17 (Left)	162533	Steel Gray

Identification Note—Part No. marked on flat end of spring with Brinell mark, and Limit Mark as follows: 1 Grind Mark—Low Limit, 2 Grind Marks—High Limit.

NASH 4160 & 4180 TYPE

Used On:

AMBASSADOR SIX, MODEL 4160 (1941)

AMBASSADOR EIGHT, MODEL 4180 (1941)

TYPE:—Independent 'parallelogram' type with coil springs. Design changed from type used on 1940 cars as follows:

Upper Control Arm—New design mounted on pivot bar bolted to bracket on frame cross-member with Caster and Camber adjusting shims on bar and at frame mounting bracket (see Adjustments below). Shock Absorbers are independently mounted (direct acting type). Knuckle support bushing on pivot pin at outer end of upper control arm is not eccentric (not used for Caster and Camber adjustment).

Shock Absorbers—Front shock absorbers are Direct Acting type mounted within front coil springs. Shock absorbers are not incorporated in front suspension upper control arm as on 1940 cars.

CHECKING & ADJUSTMENT:—Always check following points first before making any adjustments:
CAUTION—Always place 2" blocks, Tool J-886, between frame top flange and front suspension upper control arms before jacking up car so as to remove weight from front wheels. Wheels must not be allowed to hang on control arms without these blocks being installed first.
Tire Inflation—Check tires and inflate to recommended pressure of 28 lbs. (4160), 26 lbs. (4180).
Front Wheel Bearings—Check for looseness and adjust front bearings if required.
Wheel & Tire Balance & Runout—Check wheel and tire assemblies for balance. Check front wheels for runout which must not exceed ⅛". Mark high point (point of greatest runout) on tire and place this mark on top (vertical) when checking toe-in and toe-out (steering geometry), place mark on side (horizontal) when checking Camber, Caster, and Kingpin inclination.
Frame Leveling—Before checking and adjusting front end, level car by rocking it sideways and allowing it to come to rest.
Kingpin Inclination:—Should be 4½° crosswise for all models. No adjustment.
Caster:—Should be 0° to Neg. ½° for all models with car weight on wheels.
Adjustment—Caster controlled by 'C' washers installed on upper control arm pivot bar mounting bolts (between bar and frame bracket). These washers furnished in two thicknesses—1/16" (equal to 1/3°) and 1/32" (equal to 1/6°) and standard factory installation consists of two 1/32" washers on each mounting bolt. To adjust Caster, loosen pivot bar mounting bolts, add shim on rear mounting bolt (to increase caster positively), add shim on front mounting bolt (to decrease Caster), tighten pivot bar bolts. Then check camber.
Camber:—Should be Positive ¼° to Positive ¾° for all models with car weight on wheels and car level crosswise.
Adjustment—Camber controlled by same 'C' washers used for Caster setting (see Caster Adjustment above). To adjust Camber, 'C' washers should be added (to decrease Camber), removed (to increase Camber) **equally at both pivot bar mounting bolts.** One 1/16" thick 'C' washer will change Camber by 1/3°. Standard factory installation consists of two 1/16" 'C' washers on each mounting bolt.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Toe-in:—Should be 1/32-3/32" measured 10" from floor with wheels in straight-ahead position.
Adjustment—Loosen clamp bolts and turn each outer tie rod equally toward front of car to decrease toe-in, toward rear to increase toe-in. Center connecting rod is not adjustable.
CAUTION—See that center connecting rod ball stud is not raised from its normal position while making toe-in adjustment and that outer tie rod ends are horizontal with ball studs fitting squarely in seats before tightening clamp bolts.

Toe-out (Steering Geometry):—With outer wheel turned 20°, Inner Wheel should be turned 21° (plus ¾°). No adjustment. If toe-out incorrect, check for bent steering arms, recheck Caster, Camber and Toe-in.

SERVICING:—Upper Control Arm—Upper control arm frame mounting pivot bar is mounted on bushings threaded in through arm at each end of bar with seals at inner end of each bushing. When installing pivot bar, position bar within arm so that clearance at each end is equal, thread bushings in arm and on bar, tighten bushings to 150 ft. lbs. (use Torque Wrench J-1254). When installing control arm assembly on car, make certain that insulators installed on mounting bolt at each side of frame mounting bracket and that 'C' washers installed between pivot bar and frame bracket. See Caster & Camber Adjustment (above) for 'C' washer data). CAUTION—These 'C' washers control Caster and Camber and correct washers must be installed on each bolt.

Upper Control Arm Pivot Pin—Consists of a bolt threaded through both eyes at outer end of upper control arm from the rear with a lockwasher and nut on the forward end. Bolt is locked in one eye by a clamp bolt. Knuckle support is mounted on plain (not eccentric) bushings threaded on pivot pin between control arm eyes with seal at each end of bushing. When assembling pivot pin, see that bushing centered in control arm (clearance 3/16" and equal at each end of bushing), thread bolt in through control arm and bushing from rear, install lockwasher and nut on forward end of bolt and tighten nut securely.

Lower Control Arm Outer Pivot Pin. Pivot bolt is threaded in knuckle support bushing and in front and rear lower arms. Bushing is threaded on bolt and in lower end of knuckle support with rubber seal on bolt between each end of bushing and control arm. When assembling, bushing should be centered in control arm with equal clearance of 3/16" between each end of bushing and control arms.

Lower Control Arm Frame Bracket. Lower control arm inner ends are bushed on frame bracket shaft with washer and nut on shaft ends. Shaft is bolted directly to frame cross member.

SPRINGS:—Springs are not interchangeable between models. Model 4180 springs are paint marked for identification (4160 springs unmarked). Check spring heights on car with special height gauge J-709 which should fit between lower face of front frame cross-member and upper face of lower spring seat. If spring height not correct, replace spring or install special ¼" spacers under spring.

Spring Specifications

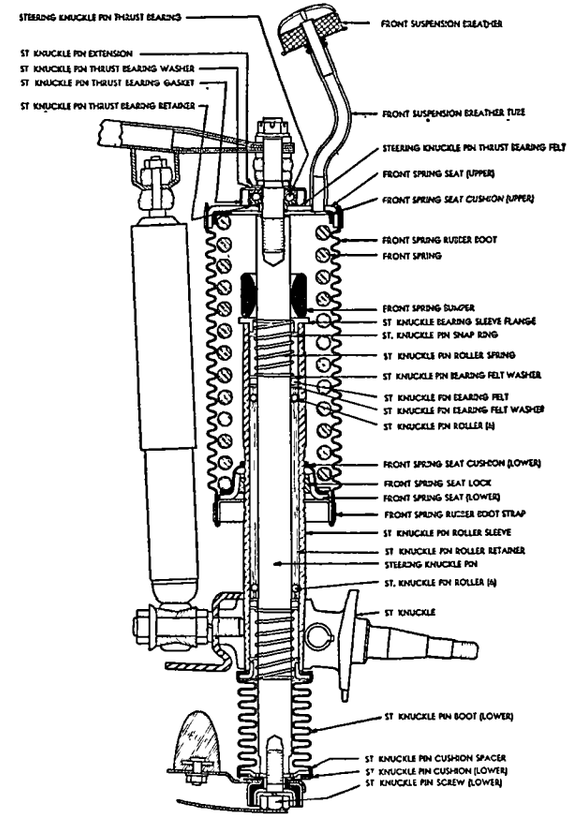
Model	Free Length	Color Mark
4160	13⅛"	None
4180	13⅛"	Yellow

NASH TYPE

Used On:

NASH AMBASSADOR '600', MODEL 4140 (1941)

TYPE:—New design independent suspension consisting of a sliding steering knuckle on a vertical fixed kingpin with the coil spring on the kingpin above the steering knuckle. Steering knuckle is mounted on 'hour-glass' type roller bearings and entire suspension system is covered by rubber boot or bellows to exclude dirt (bellows provided with breather with air cleaner mounted on frame). Kingpin is rigidly mounted on the front frame cross-member at the bottom and is positioned by two frame strut rods (Caster & Camber adjusters) at the top. In addition, both kingpins are tied together by a strut rod extending across the car between them and this rod serve also as the top mounting for the direct acting shock absorbers which are connected to the steering knuckles at the bottom (see illustration). With this type construction, wheel movement causes steering knuckle to slide up and down on the kingpin and is controlled by coil spring and shock absorber.



CHECKING & ADJUSTMENT:—Always check following points first before making any adjustments:
Tire Inflation—Check tires and inflate to 28 lbs. (Std. 5.50x16 tires), 22 lbs. (Optl. 6.00-16).
Front Wheel Bearings—Check for looseness and adjust bearings if required.
Wheel & Tire Balance & Runout—Check front wheels and tire assemblies for balance. Check front wheels for runout which must not exceed 1/16". Mark high point on tire (point of greatest runout) and place this mark vertically (at top of wheel) when checking toe-in and toe-out (steering geometry), place mark horizontally (on one side) when checking Caster, Camber, and Kingpin Inclination.
Wheel Straight-ahead Position—Wheels must be in straight ahead position with steering gear roller on 'high' point of worm. See Steering Gear article for adjustment directions. Place wheels in straight ahead position when checking front end.
Spring or Frame Height—Springs should be same height so that car is level crosswise when at rest. See Spring data (below) for adjustment directions NOTE—Car weight must be on wheels when following specifications are being checked.

Kingpin Inclination:—5½° crosswise. Not adjustable but kingpin inclination affected by Camber Adjustment (see Camber below).

Caster:—0° ± ¼°. Controlled by brace rods attached to top of kingpin and frame on each side of car.
To Adjust—Loosen nuts on frame bracket end of both brace rods attached to top of kingpin, turn nuts so as to shorten rear rod and lengthen front to increase caster, lengthen rear rod and shorten front rod to decrease caster. One and one-half turns of nut on each rod will change caster approximately ¼°. Tighten all nuts securely after adjustment completed. CAUTION—Rod can be adjusted only after nuts on second rod have been loosened to permit movement. Do not attempt to adjust one rod only.

Camber:—0° to Pos. ½°. Controlled by brace rods at upper ends of kingpin (same as Caster). NOTE—Kingpins are tied together by non-adjustable strut rod at upper ends so that any increase of camber at one wheel causes equal decrease of camber at opposite wheel.
To Adjust—Adjust in same manner as Caster (above) except that nuts should be turned so as to lengthen or shorten both the front and rear brace rods equally (Caster will be changed if rods adjusted unequally) and nuts must be loosened on brace rods on opposite side of car to permit movement of the rods.
CAUTION—Rods on one side of car can be adjusted only after rods on opposite side have been loosened.

Toe-in:—0-1/16" measured approximately 10" up from floor. Do not move wheels while toe-in being checked.
To Adjust—Loosen clamp bolts on adjusters at wheel end of each tie rod, turn both adjusters eqully. CAUTION—After toe-in adjusted, tie rod adjuster clamp bolts must be turned toward ground to prevent interference with body sill as wheel moves

Toe-out (Steering Geometry):—With outer wheel turned 20°, inner wheel should be turned 21° plus ½°. No adjustment. If toe-in incorrect, check for bent steering arms. Recheck Caster and Camber.

SERVICING:—Suspension Unit Removal—Loosen two clamps holding upper rubber boot (bellow) lower boot, install special clamps J-1608-SA-1 on lower coils of spring, raise wheels off floor and hook upper ends of clamps on top coil of spring, lower wheels and tighten clamps (clamps will hold spring compressed while unit being dismantled). Disconnect tie rods at steering knuckle arms, raise front end of car, remove wheel and brake drum, brake backing plate, and shock absorber. Remove steering knuckle pin screw holding lower end of kingpin on frame front cross-member (front axle channel), raise lower boot and install wrench on flats of kingpin to prevent it turning. Loosen nuts on brace rods at upper ends of both kingpins, remove strut or

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

tierod extending across car between upper ends of kingpins, slip brace rods off top of kingpin, remove suspension unit from car.

Suspension Unit Disassembly—To dismantle assembly after removal from car (with upper boot loosened and clamps installed on springs), unscrew kingpin extension on upper end of kingpin, remove extension (with upper spring seat), lift off spring with clamps intact. Remove retainer spring and flange from upper end of kingpin by tapping lightly with hammer, remove lower spring seat and spring locks (locks are split washers installed in grooves in sleeve), remove screw, cushion and lower boot. Push kingpin toward upper end of sleeve and remove snap ring in groove in lower end of sleeve, then push kingpin toward lower end of sleeve and remove upper snap ring in same manner. Withdraw kingpin, roller retainer tube, and rollers from sleeve using care not to lose rollers (rollers will drop out of slots in retainer tube as it is withdrawn). Tap steering knuckle off lower end of sleeve. Wash all parts in clean gasoline and use extreme care to prevent dirt or other foreign matter entering assembly.

Suspension Unit Assembly—Clamp steering knuckle in vise and install sleeve. Lubricate kingpin, roller retainer and rollers with special Nash No. 3107687 lubricant (pack lubricant between roller retainer and kingpin), install assembly in sleeve (CAUTION—make certain that all rollers in place in retainer slots when retainer installed). Check to see that sleeve moves up and down and rotates freely on kingpin. Clamp unit in vise so that kingpin horizontal, install steel washer, felt washer, and second steel washer on upper end, push kingpin toward lower end of sleeve and install upper snap ring. Install same washer assembly on lower end of kingpin and install lower snap ring. Install lower retainer spring, flange, lower boot, cushion, disc and screw (do not tighten screw as it must be removed to install unit on car). Place unit vertically and install lower spring seat and locks (locks regularly installed in center groove—see spring data below), tap upper spring and flange in place using special driver. Install upper bumper and spring, install kingpin extension and tighten securely (hold kingpin from turning by wrench on flats at lower end). Leave clamps on spring until unit installed on car.

Installing Suspension Unit on Car—Reverse removal directions given above. Check Caster, Camber, Kingpin Inclination and Toe-In.

Lubrication:—Unit is packed with special lubricant, Nash No. 3107687, and requires no attention in service (see Assembly directions above). Dirt must be prevented from entering assembly and upper and lower boots must be in place. Lower boot must be kept free from excessive lubricant (lower end of kingpin wiped clean before boot installed).

Air Cleaner:—On frame and connected to vent tube leading to upper boot. Air cleaner should be removed and washed in gasoline every 5000 miles.

SPRINGS:—Front springs are same on all models and can be raised or lowered to compensate for unequal length and to level car crosswise. Spring height controlled by position of locks in slots on sleeve below lower spring seat. Shifting locks up or down one slot on sleeve will change spring length 3/8". Locks are regularly installed in middle slot on sleeve.

Spring Specifications

Car Model	Part No.
4140	3107019

NOTE—Right and Left springs are the same.

OLDSMOBILE-PONTIAC TYPE

Used On:

OLDSMOBILE SIX, 66, 76, 96 (1941)
OLDSMOBILE EIGHT, 68, 78, 98 (1941)
PONTIAC SIX, 41-24, 25, 26 (1941)
PONTIAC EIGHT, 41-27, 28, 29 (1941)

TYPE:—Independent 'parallelogram' type with coil springs. Design changed from type used on 1940 models as follows:

Camber Adjustment (Upper Pivot Pin)—Amount of eccentricity increased from 1/16" to 3/32" for greater range of Camber adjustment (see Camber Adjustment below).

CHECKING & ADJUSTMENT:—Check and adjust front wheel bearings, check kingpins for looseness, check shock absorbers and following points:

Tire Inflation—Check tires and inflate to 28 lbs. front and rear (Oldsmobile 66 and all Pontiac models), 26 lbs. front and rear (Oldsmobile 68, 76, 78), 24 lbs. front and rear (Oldsmobile 96, 98).

Wheel Runout—Check wheels and tires for run-out. Must not exceed 1/8". Mark 'high' point on tire and place this mark at top (vertically) when checking Toe-in and Toe-out, at one side (horizontally) when checking Caster, Camber & Kingpin Inclination.

Frame Height—Raise and lower front end of car several times by grasping front bumper to allow frame to come to normal level.

NOTE—Car weight must be on wheels and wheels should be set in straight ahead position when checking adjustment.

Kingpin Inclination:—4°51'10" crosswise (Oldsmobile), 4 3/8 to 4 7/8° crosswise (Pontiac).

Caster:—0° to Negative 3/4° (Oldsmobile), Negative 3/4° (limits Neg. 1/2° to Neg. 1°) on Pontiac models. Must be equal within 1/2° on both sides of car. Machined bosses provided on front side of knuckle support for protractor mounting.

To Adjust—Loosen clamp bolt in upper end of knuckle support, remove lubricant fitting on front bushing of upper support pivot pin, insert Allen wrench J-720 through lubricant fitting hole and turn upper pivot pin clockwise to increase caster, counter-clockwise to decrease caster. CAUTION—Pin must always be turned in complete turns only to avoid disturbing camber adjustment (below).

Camber:—Negative 1/4° to Positive 3/4° (Oldsmobile), 0° (Neg. 1/4° to Pos. 1/4°) Pontiac.

NOTE—Camber adjustment (upper pivot) pin eccentricity has been increased from 1/16" to 3/32" to provide greater range of Camber adjustment.

To Adjust—Same as for Caster (above) except that entire range of adjustment secured in 1/2 turn of eccentric pivot pin. CAUTION—Do not turn pin more than 1/2 turn when adjusting camber to avoid disturbing caster adjustment.

Toe-In:—1/16-1/8" (Oldsmobile), 0-1/16" (Pontiac) measured 9-10" above floor with wheels straight ahead.

To Adjust—Loosen clamp bolts at wheel end of each tie rod, turn tie rod adjuster on each rod equally. On Oldsmobile, turn both adjusters in direction opposite to that in which wheel revolves to increase toe-in. On Pontiac, turn right hand adjuster in same direction wheel revolves, and left hand adjuster in opposite direction to increase toe-in.

Steering Geometry (toe-out on turns):—With outer wheel turned exactly 20°, inner wheel should be turned 23° ± 1/2°. No adjustment provided (check for bent steering arms if incorrect).

SERVICING:—**Lower Control Arm & Pivot Shaft**—Serviced as an assembly and not interchangeable on right and left sides of car. Pivot shaft at inner ends of control arms can be removed by taking out bushing in each arm. To install shaft, install tool J-1052 or block between arms adjacent to shaft eyes so that distance between inner faces of arms at shaft eyes is exactly 11 1/2" (necessary to prevent distortion of arms when bushings installed). Install shaft with seal on each end adjacent to mounting bracket, thread bushing in on shaft and in arm simultaneously (new bushings cut their own thread in arm as they are turned in), tighten bushings with 150 lb. pull on 16" wrench (200 lbs. on 12" wrench) so that there is no clearance between bushing flange and control arm. See that distance between shaft bracket mounting holes and inner face of control arm is exactly 1 1/2" at each end (turn shaft to centralize), and that seal ends lap over bushings.

Knuckle Support Lower Pivot Pin—To install pin, slip rubber seal over outer end of each lower control arm, center knuckle support between lower control arms (approximately 1/8" between end of bushing and front arm, same distance between head of bushing and rear arm). Screw pivot pin through front arm, knuckle support bushing, rear arm, install nut on rear end of pin. Pull seals down over end of arms so that they seat on pin between arm and bushing at each side.

Knuckle Support Upper Pivot Pin—To install, center knuckle support in upper control arm yoke, screw pivot pin in until larger center section is centered in knuckle support, tighten clamp bolt. Install seal on pin at each side, start front bushing in on pin, then screw rear bushing in control arm and on pin and tighten securely. Turn front bushing in until clearance between front face or arm and head on bushing is 1/32" and tighten clamp bolt.

Kingpin Installation (Oldsmobile)—Bushings should be installed with oil hole lined up with oil hole in knuckle support and short groove on inner surface leading from oil hole to outer end of bushing (up on top bushing, down on lower bushing). Bushings should be burnished with J-722-1 burnishing tool and line-reamed to size with tool HM-592.

Kingpin Installation (Pontiac)—Bushings are floating type and should be installed with lubrication groove on inner face leading toward outer end of bushing (up on top bushing, down on lower bushing).

SPRINGS:—Lower end of spring not ground flat and must be installed with end coil fitted into recess in lower spring seat. Upper end of spring is ground flat. CAUTION—Spring must be installed with flat (ground) end up and lower end fitted in spring seat. Oldsmobile springs are paint marked on end coil for identification.

Oldsmobile Springs

Model	Wire Diameter	Color Mark
66	.587"	Green & Orange
68	.625"	Aluminum
76, 96	.619"	Green & Yellow
78, 98	.635"	Green & Brown

Pontiac Springs

Model	Wire Diameter	Free Length
41-24, 26, 27	.608"	15 3/16"
41-25	.608"	14 27/32"
41-28, 29	.625"	15 15/32"

PACKARD SAFE-T-FLEX TYPE

Used On:

'110' SIX, MODEL 1900 (1941)
'120' EIGHT, MODELS 1901, 1A (1941)
'160' SUPER EIGHT, 1903,3A,4,5 (1941)
'180' CUSTOM SUPER EIGHT, 1906,7,8 (1941)

NOTE:—Packard Clipper—This model has new 'parallelogram' type Independent Suspension. See separate article (following) for data on this model.

PRODUCTION CHANGE NOTE:—Kingpin Thrust Bearing (Six & Eight)—Special antimony-lead type thrust bearing used on first cars with roller bearings at each end of steering knuckle kingpin. These bearings changed on later cars to ball thrust bearing and bronze bushings on kingpin. Later type unit bearings only furnished for service. NOTE—New type ball thrust bearing can be installed without replacing roller bearings on kingpin if these bearings in good condition. Antimony-lead thrust bearing has tendency to bind and cause steering stiffness if not lubricated frequently.

Kingpin Bushings (Super Eight)—Antimony-lead bushings used on steering knuckle kingpin on first cars with ball thrust bearing. Changed to roller bearings on later cars (no change in thrust bearing). Roller bearings only furnished for service (antimony-lead bushings have tendency to bind and cause steering stiffness if not lubricated frequently).

TYPE:—Independent 'Safe-T-Flex' type. Same design as used on corresponding 1940 models (see Production Change Note above for different type bearings used).

CHECKING & ADJUSTMENT:—Check front wheel bearings and set wheels in straight ahead position, check following points first:

Tire Inflation—Check tires and inflate to correct pressure for each model.

Frame Height—Must be correct when checking caster and camber. To check, load car with 300 lbs. (front—all models), 225 lbs. (rear—Coupe), 375 lbs. (rear—5 Pass. Sedan), 675 lbs. (rear—7 Pass. Sedan), 500 lbs. (rear—1901A Hearse), 800 lbs. (rear—1903A Hearse). Measure from floor to top of frame side rail at front spring center-line (front) from underside of frame to top of axle housing (rear). If height not correct, install spacer or replace spring (see Springs below).

Car Model	Front—Frame Height—Rear
1900 Six	17⅝"—5⅜"
1901 Eight	18⅛"—5¼"
1901A Comm'l.	18¾"—5¾"
1903, 4, 5, 6, 7, 8	18¾"—5¼"
1903A Comm'l.	19¼"—5¾"

Kingpin Inclination—2½° crosswise (all models). NOTE—Car weight must be on wheels when checking following adjustments.

Toe-in:—0" to 1/16" at hub height (all models).

To Adjust—Loosen clamp bolts and turn both tie rods equally. Tie rod lengths must be equal within ⅛" after adjusting with intermediate steering arm centered and steering wheel roller on 'high' point of worm (adjust by shortening one rod, lengthening opposite rod equally). NOTE—If tie rod lengths not equal within ½" with intermediate steering arm centered and steering gear in straight ahead position, check for bent steering knuckle arms.

Caster:—Positive ½° ± ½° (Six & Eight), Negative ¾° ± ½° (Super 8 except 1903A), Positive 2½° ± ½° (1903A).

To Adjust—Install wedge shims (furnished in ½° and 1° taper) between front face of lower torque arm and lower control arm. Install shims with thick end up to decrease caster, thick end down to increase caster. If 1° shim does not correct caster, check for bent parts. Check torque arm alignment (end of arm must be square with face of lower control arm).

Camber:—½° (limits ½° to 1¼°) for all models.

To Adjust—Remove support pin linking upper control arm and knuckle support, change pilot thimbles in outer end of each upper control arm. Thimbles furnished with offset of 0", 1/16", ⅛", 3/16", and change of 1/16" in offset will change camber ⅓°. CAUTION—Make certain that thimbles installed in both arms with offset in same direction (reversing offset will change camber).

Steering Geometry (toe-out on turns):—With outer wheel turned exactly 20°, inner wheel should be turned 23½° (all models). No adjustment provided (check for bent steering arms if incorrect).

SERVICING:—Upper Control Arm Damper—To check, remove knuckle support upper pivot bolt at outer end of shock absorber arms and damper bolt at center of arms. Clearance between arms at damper friction disk should be .125-.135". If clearance not correct arms should be straightened or replaced. Damper tension spring pressure should be 105-115 lbs. compressed to 13/16". To assemble damper, install spring on bolt, insert bolt through arm which has larger hole, tighten nut securely so that opposite arm seated against shoulder on bolt.

Upper Control Arm Pivot Pin—Knuckle support is mounted on two Harris type rubber bushings on pivot pin at outer end of upper control arm. When installing pivot pin, tighten nut securely (bushing compression regulated by spacer sleeve on pin).

Lower Control Arm Pivot Pin—Pivot pin is clamped in knuckle support and is mounted on special roller bearings in control arm ends with ball thrust bearing between knuckle support and rear arm. Bearing should be pre-loaded by installing thrust bearing shims (furnished in .001" thickness steps) between arm and support so that pull of 1-6 lbs, required to move upper end of knuckle support with upper pivot bolt removed. CAUTION—Roller bearings are caged type and one of the two bearings must be renewed whenever pivot pin or either bearing is removed.

Lower Control Arm Frame Mounting—Arm is rubber bushed on frame bracket pin (two Harris type bushings used, bushings held by locking ring on pin at one end-washer). Bushings can be installed without using arbor press but must be aligned in neutral position (flat on pin must be in line with flat on special gauge bolt installed in hole in outer end of arm—use special gauge No. ST-5157.

Torque Arm Frame Mounting (Six, Eight, Super 8 1903, 6 Only)—Mounting at frame consists of two Harris type rubber bushings in end of arm. When installing torque arm, tighten mounting bolt until frame mounting bracket bottoms on bolt shoulder. NOTE—Frame mounting on other models consists of a hollow rubber ball installed on end of torque arm and clamped in frame bracket. Dip the hollow rubber ball in soap water to facilitate installation of torque arm ball.

Kingpin Bushings—See Production Change Note above. When installing the service bronze bushings, bushings should be finished to size by burnishing with Packard Burnisher ST-5046 or reamed to inside diameter of .866". Kingpins also furnished .005" oversize to compensate for worn spindle bushing holes. NOTE—When installing kingpins, adjust thrust bearing pre-load by installing shims (furnished in thickness steps of .001") so that force of 3½-5 lbs. applied at end of spindle is required to turn spindle on kingpin.

SPRINGS:—Springs paint-marked for identification as shown in table below. If frame height not correct, install not more than two spacers #326836 (¼" thick) between upper spring cup and insulator on top of spring (if two spacers used, install Insulator #326706 between spacers). If height cannot be corrected by this means, replace springs.

Std.—Spare at rear. **FW.**—Cars with Fender Wells.
1908 Note—LeBaron Sedan & Limousine only.

PACKARD CLIPPER TYPE

Used On:

PACKARD CLIPPER, MODEL 1951 (1941)

TYPE:—Independent 'parallelogram' type with coil springs. Design not like that used on other Packard models in that torque arm not used. Lower control arm consists of a double arm pivoted on a bracket shaft bolted on the front frame cross-member near the center with the lower spring seat riveted on the arms. Spring seat also serves as a mounting for the lower rubber bumper and has a connection for the front stabilizer bar link.

CHECKING & ADJUSTMENT:—Check front wheel bearings and set front wheels in straight ahead position. Check following points in order:

Tire Inflation—Check tire pressures which should be 26 lbs. (front), 28 lbs. (rear) warm.

Frame Height—See that car is level crosswise and check springs for equal height.

Kingpin Inclination:—5°35' crosswise.

Toe-in:—0" to 1/16" measured at hub height.

To Adjust—Loosen clamp bolt and turn tie rod adjusters (at wheel end of each tie rod) equally.

Caster:—Negative 1° plus or minus ½°.

Camber:—¼° plus or minus ½°.

STUDEBAKER PLANAR TYPE

Used On:

CHAMPION, MODEL 3G (1941)

COMMANDER, MODEL 11A (1941)

PRESIDENT, MODEL 7C (1941)

SPECIAL SERVICE NOTE:—Raising Front of Car—Whenever front end of car is raised to provide clearance for work under front end, special supports must be used so that weight properly distributed on suspension system. Use Planar Lifting Bar, Tool No. S-15, for this purpose, installing bar on jack and engaging bar under front spring.

TYPE:—Independent 'Planar' type suspension with leaf type spring serving as lower control arm. Design changed from type used on 1940 models as follows:

Control Links (all models)—Stamped steel control links are used on all cars. These are pivoted on front spring plate (Champion), front frame crossmember (Commander & President) at center of car (inner end) and are attached by spring bolt to steering knuckle lower yoke at outer end.

CHECKING & ADJUSTMENT:—Adjust front wheel bearings, check shock absorbers, steering gear adjustment, steering arm and tie rods for looseness. Check following points first:

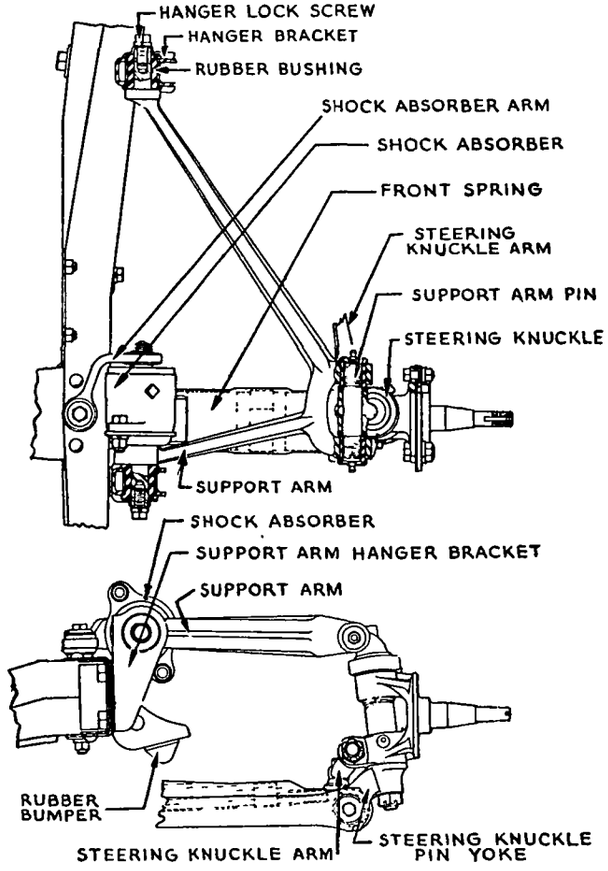
Frame Height—Raise and lower front end several times by grasping bumper so that frame will assume normal position.

Tire Inflation—Check tires and inflate to 26 lbs. (Champion—front), 28 lbs. (Champion—rear), 28 lbs. (Commander—all), 26 lbs. (President—all).

Kingpin Inclination—5½° crosswise (all models).

Caster:—1-2° (Champion), Negative ¼° to Positive ¾° (Commander & President). Caster angle is determined by front spring and is not adjustable.

Camber:—½° (¼—¾°) for all models.



To Adjust—Loosen upper support arm frame mounting bracket bolts, remove shims from between mounting bracket and frame to decrease camber, add shims to increase camber (shims slotted). One thin shim will change camber ¼°, thick shims are equal to four thin shims. Tighten bracket bolts securely after adjusting. CAUTION—Make certain that shim thickness equal on both mounting brackets (add or remove shims equally at each bracket when making adjustments).

Toe-in:—1/16-⅛" (all models).

To Adjust—Set steering gear in straight ahead position (center of travel with lever lugs on 'high' points of cam), loosen clamp bolts and turn **left hand** reach rod until left hand wheel is in straight ahead position (parallel to rear wheel). Then loosen clamp bolts and turn **right hand** reach rod (between steering idler arm and right hand wheel) to adjust toe-in. CAUTION—Toe-in adjustment must be made exactly as detailed above to insure correct steering gear position.

Steering Geometry (toe-out on turns):—With outer wheel turned exactly 20°, inner wheel should be turned 22½-23° (Champion), 22-22½° (Commander & President). No adjustment provided. Check for bent steering arms if incorrect.

SERVICING:—Support Arm & Steering Knuckle Removal—Disconnect reach rods at steering arms. Support front end of car, remove spring bolt (lower pivot pin) by unscrewing bolt from lower steering knuckle yoke, spring eye, and lower control link. Take out two bolts mounting front shock absorber on upper control arm, take out shock absorber arm bolt in frame rail, remove shock absorber. Remove screws and washers on inner ends of upper control arm which retain frame mounting bracket rubber bushings, loosen control arm front frame bracket,

remove shims from between bracket and frame (these shims control Camber and exact same number must be re-installed to avoid disturbing camber adjustment), slip frame bracket off control arm bushing and remove. Disengage steering knuckle lower yoke from spring eye, shift entire assembly forward to free upper control arm from rear frame mounting bracket bushing, remove assembly from beneath car.

Installation—When installing assembly on car, dip rubber bushing in gasoline before installing bushing in frame suport bracket (CAUTION—Oil, soap or hydraulic brake fluid must not be used on bushings as this will allow bushings to turn in brackets in service). Make certain that correct shim pack installed between support bracket and frame (re-install same shims removed when bracket taken off). See that steering knuckle lower yoke centered on spring eye (equal clearance at each side) when installing spring bolt. Hold control arm in horizontal position while tightening control arm screws at frame bracket (to insure proper position of rubber bushings in frame bracket).

Steering Knuckle Assembly:—Lower yoke is press fit on end of steering knuckle pin and must be removed and installed in an arbor press. To dismantle steering knuckle assembly, drive out taper lock pin in upper end of steering knuckle pin (this pin locks upper control arm pin in knuckle), remove pin bushings and pin, remove upper control arm. Remove nut and cotter pin from lower end of knuckle pin, press knuckle pin out of lower yoke, remove yoke and knuckle pin from steering knuckle.

Steering Knuckle Bearings—Knuckle pin mounted on needle bearing (top), bushing (bottom) with ball thrust bearing between upper end of pin and steering knuckle (endplay adjustment shims installed between bearing and knuckle). Use special Arbor, No. J-1294 (Champion), J-1277 (Commander & President—with sleeve), to press out bushing and needle bearing. Install new bushing first on Champion (bushing need not be reamed), then install spacer tube (oil holes in spacer and knuckle must line up), and needle bearing using arbor J-1294 to press bushing and needle bearing in place. On Commander & President, install bushing and needle bearing in same order (no spacer tube used) using arbor and sleeve J-1278. When installing knuckle pin, check endplay as follows:

Thrust Bearing & Endplay Adjustment—Install knuckle pin and thrust bearing in steering knuckle, check endplay which should be .003-.006" by placing feeler gauge on lower face of knuckle. Face of feeler gauge should be flush with edge of shoulder on steering knuckle pin. Add or remove shims between thrust bearing and upper face of steering knuckle to secure this desired endplay of .003-.006".

Upper Control Arm Pivot Pin—Before installing upper control arm pivot pin bushings, measure outside dimension of yoke at outer end of control arm with .010" feeler under one leg of caliper gauge (dimension will be total width plus .010"). Then use special spreader tool, No. J-1524 installed on outer end of control arm yoke to spread yoke exactly .010" so that caliper is snug on yoke without feeler gauge. With arm spread in this manner, assemble knuckle pin and pivot pin in control arm yoke, install bushings. After bushings have been tightened securely, remove spreader. See that taper lockpin installed in upper end of knuckle pin to lock pivot pin in place.

Insulated Steering Arm—To remove assembly from steering gear shaft, remove cotter pin, nut, and washer from steering gear lever shaft, use puller J-871 to remove assembly from shaft (On Champion, nuts on steering arm bushing studs can be removed and arm pulled off without disturbing adapter arm on steering gear lever shaft). Adapter shaft and steering gear shaft are marked and marks should be lined up when assembly re-installed.

SPRINGS:—Front spring is transverse leaf type. Spring eye is formed in main leaf and second leaf is wrapped around eye for additional strength.

STUDEBAKER PRESIDENT, MODEL 7C (1941)

Model 41-3

GRAHAM HOLLYWOOD, 109, 113 (1941)

CROSLEY NOTE:—Crosley Axle is new design with Torque Tube drive. Serviced in same manner as other Spicer models after torque tube has been removed. Torque type on 1941 models is modified for new Universal Joint mounting (in adapter at rear end of transmission case).

TYPE:—Spiral Bevel or Hypoid Gear, semi-floating type with Hotchkiss drive (except Crosley—see note above). Shim adjustment provided for Pinion Bearing and Pinion Setting, Ring Gear Backlash and Differential Bearing adjustment. Same design as used on corresponding 1940 car models.

SERVICING:—Paint gears to check mesh or check pinion setting. See Ring & Pinion Gear Backlash and Pinion Setting data below.

Axle Shaft Endplay—Total endplay for both shafts should be .005" (Bantam), .001-.005" (Studebaker), .002-.007" (others). When adjusting, shims should be removed equally at both wheels to keep thrust block at inner ends of axle shafts centered on differential pinion shaft (excessive shim removal at one wheel will cause block to bind on shaft).

Ring & Pinion Gear Backlash—Should be .006-.008" Bantam), .005-.007" (Studebaker), .004-.008" (others). Adjusted by shifting differential bearing shims from one side to the other (total must be kept the same to avoid disturbing differential bearing adjustment).

OVERHAUL:—**Disassembly.** To remove differential assembly (with axle shafts out), take out bearing cap screws, remove bearing caps, pull differential assembly out. Remove nut on end of pinion shaft, take off rear universal joint flange, press pinion out of housing toward rear to avoid damage to oil seal and bearing. Pry oil seal out toward front. Use new oil seal when reassembled if old seal worn or damaged.

Pinion Bearing Assembly:—Make certain that pinion setting shims installed in housing ahead of rear bearing cup, insert pinion and rear bearing cone in housing from rear, install spacer and pinion bearing adjusting shims on pinion shaft, tap front bearing cone in place, assembly universal joint flange, tighten nut securely (if bearing adjustment to be checked, oil seal assembly may be left out until adjustment completed).

Pinion Bearing Adjustment. With pinion shaft nut tight, pinion should rotate with slight drag (no endplay). Adjust by removing front bearing cone and adding or removing shims between cone and spacer or shoulder on shaft. Shims furnished .003", .005", .010", .030" thick.

Pinion Setting:—Use special Pinion Setting Gauge, Salisbury No. J-772 or Studebaker No. J-589-D (see note below for Hypoid Gear Fittings). Set micrometer on gauge to correct figure for each axle model (see table below—this figure correct for standard pinions marked '0' on end) and correct micrometer for each pinion as follows: Figure etched on pinion, indicates amount (in thousandths) that pinion should be set in toward ring gear (— figures) or out away from ring gear (+ figures). Install gauge in axle housing in place of differential assembly with side discs seated on differential bearing bores, add or remove shims located between rear bearing cup and shoulder in housing until micrometer pointer just contacts ground face of pinion gear (or adapter on hypoid gears—see note below).

Hypoid Gear Pinion Setting. Pinions are offset and micrometer gauge pointer will not contact ground face of pinion. Use special adapter on face of pinion and adjust so that micrometer pointer contacts face of offset plate on adapter. Special clamp can be bolted on face of axle housing which has setscrew to hold adapter on pinion.

Axle Model	Zero Cone Setting
10	.218"
21-1	.407"
23, 41-2, 41-3	.719"

Model 10 Note—Special smaller pinion gauge must be used for this model (endplate diameter of 2.714-2.716"). Pointer extends 2.000" beyond differential bearing bore center-line with micrometer set at zero.

Model 11 Note—This is special small axle and regular pinion setting gauge cannot be used.

Differential Bearing Adjustment:—Shims installed on differential case hub at inner end of each bearing cone. To adjust differential bearings (with axle dismantled), remove bearing cones, add or remove shims until differential assembly will just slide into housing (no endplay when installed), then add additional .003-.006" (except Studebaker), .008" (Studebaker) shim thickness to secure correct bearing preload. Shims furnished .003", .005", .010", .030" thick. With correct adjustment, fairly heavy drag should be felt when ring gear revolved by hand (test preferably with pinion out to avoid added drag of pinion bearings and oil seal). When installing differential assembly, tighten bearing cap screws securely.

Ring Gear Backlash Adjustment—When adjusting backlash, shift shims from one side of differential case to the other. Total shim thickness must not be changed as this would disturb differential bearing adjustment.

COLUMBIA TWO-SPEED TYPE

Optl. Equipment On:

FORD, ALL PASS. CAR MODELS (1941)
LINCOLN, ZEPHYR & CONTINENTAL 16H (1941)
LINCOLN, CUSTOM MODEL 168H (1941)
MERCURY, MODEL 19A (1941)

TYPE:—Two-speed type rear axle consisting of a planetary gear reduction unit built in a special differential assembly case. Same design as used on 1940 car models.

SERVICING & ADJUSTMENT:—All specifications and servicing operations same as for previous models. ***Refer to manual (or 1939 supplement) Mechanical Equipment Index for 'Columbia Two-Speed Type' axle article for data.***

BUICK HYPOID TYPE

Used On:

SERIES 41-40,40A,50,60,70,90 (1941)

SPECIAL SERVICE NOTES:—Axle Markings—Axle ratios may be identified by figures stamped on underside of axle housing or paint marks on outer ends of both axle shaft flanges as follows:

Model	Ratio	Paint Mark
40 Single Carb. Std.	4.4-1	White
40 Single Carb. Optl.	3.9-1	Red
40,50 Compd. Carb.	4.1-1	None
50 Optl., 60,70 Std.	3.9-1	Red
60,70 Optl.	3.6-1	Blue
90 Std.	4.2-1	None

Axle Shaft Retainer 'C' Washer—New type reduced throat self-locking retainer washers are used. Special service tool, J-1515, is required to remove these new washers (tool is slotted driver used to engage ends of washer so that it can be driven out. NOTE—this new type self-locking washer used on late 1940

TYPE:—Hypoid gear, semi-floating type. Same design as used on corresponding 1940 models (see special service notes above).

SERVICING:—Gear Adjustment. Check pinion setting (see instructions below) or paint gears to check mesh. Backlash should be .006-.010" for new gears (slightly more for worn gears). Total lash measured at outside diameter of tire (one wheel jacked up) should not exceed ¾". To adjust backlash, back off one differential side bearing adjusting nut, tighten opposite nut equal amount (see Differential Bearing Adjustment below).

Axle Replacement:—Axles retained by 'C' washer at inner end (all models). To remove axle shaft, take out locking pin, remove differential pinion shaft and spacer block, push axle in and remove 'C' washer at inner end within differential side gear, pull shaft out (wheel bearing inner race is press fit on shaft and will be removed with it, outer race is light press fit in axle housing and can be removed with J-528-B puller).

NOTE—'C' washer is new self-locking type and tool J-1515 must be used to remove washer from shaft.

Axle Shaft Endplay. Controlled by spacer block between axle ends in differential case and should be .000" minimum, .008" maximum. Four block sizes used in production, replacement spacer block ground on all sides for min. and max. production sizes. **Important**—New bronze side gear thrust washers should be installed back of differential side gears before new axle shaft spacer block installed to correct endplay (not possible to secure correct endplay of .008" maximum with spacer block only if thrust washers worn).

NOTE—Right hand axle shafts are ¾" longer (40,50,60,70), 15/16" longer (90) than left hand shafts and must not be interchanged.

Propeller Shaft Front Bearing (90)—Consists of a bronze bushing and seal in a cast iron body installed in forward end of torque tube and retained by setscrew. Bearing is lubricated from transmission but when new torque tube being installed, ½ pint of transmission oil should be poured in end of torque tube before it is attached to ball joint at transmission.

Torque Tube (40, 50, 60, 70). Do not disturb bolted connection between torque tube flange and carrier flange unless installation of new gasket required to stop oil leaks (special gasket required). Tube and carrier are matched and must be kept lined up (furnished as an assembly only, separate parts not available).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

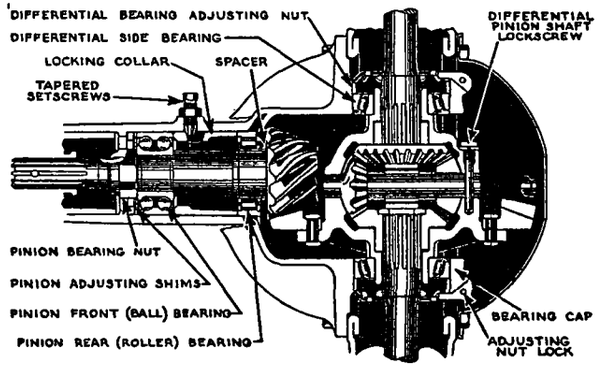
OVERHAUL:—Disassembly. Mark differential bearing adjusting nuts and bearing caps before disassembling. To remove pinion and shaft assembly, loosen locknuts and take out taper setscrews on side of housing. To remove pinion from propeller shaft, file off head of pin and drive out, use tool J-1292-B to pull pinion from propeller shaft (this tool used also to install pinion). Pry up staked portion of pinion bearing nut, remove nut, dismantle bearing assembly.

Pinion Bearing Assembly:—Bearings should be press fit on pinion shaft (use tubing of correct diameter to engage inner race when pressing bearings on shaft). No inner race used for rear pinion bearing (outer race and rollers furnished as assembly) and spacer must be installed between rollers and pinion to prevent creeping. Tighten pinion bearing nut securely and stake into notch on shaft. Assemble pinion to propeller shaft riveting pin to prevent it loosening in service (see propeller shaft straightening below). When installing assembly in housing, tap outer race of rear bearing in against shoulder in housing or bearing collar (90) to prevent the race rubbing on pinion. Make certain that adjusting shims installed ahead of front bearing and tighten setscrews and locknuts securely.

Pinion Rear Bearing Tool—With some optional gear ratios, pinion is larger in diameter than rear bearing and special forked tool must be inserted between pinion and bearing so that pinion bearing can be driven in place (use bronze driving block to drive on face of pinion), remove tool after bearing seated in carrier bore.

Propeller Shaft Run-out. With propeller shaft supported on 'Vee' blocks at point just behind splines at forward end and rear pinion bearing outer race at rear, run-out on tubular shaft 1½" back of forward end should be less than .005", run-out at center of tubular shaft should be less than .010", run-out at front pinion bearing outer race should be less than .001". With these limits, run-out at universal joint end (before joint connected) should be less than 1/16" (greater run-out will cause universal joint bushing wear and possible oil leak from transmission).

CAUTION—Do not put oil in propeller shaft when installing pinion. This will cause roughness at high speed.



Ring Gear Installation:—Ring gear and pinion furnished only in matched sets. To remove old gear, drill out rivets with ¼" drill on differential case flange side (cutting rivets with chisel will distort case). Case run-out must be less than .002" with gear removed. Bolt ring gear in place with 5/16" bolts in alternate holes, then install opposite rivets between bolts, remove bolts and finish riveting. Run-out at back of gear must not exceed .004".

Pinion Setting:—Pinions marked on rear face by etched figure and plus or minus sign for necessary correction of standard setting (micrometer reading for standard settings given below). Plus sign indicates that pinion should be moved away from axle shaft center-line, minus sign toward axle center-line, the amount (in thousandths) of the figure following this plus or minus sign. Use J-681-A Pinion Setting Gauge, check micrometer '0' on test fixture, set micrometer to standard figure (as given in table below for each model, turn micrometer pointer in (for plus figure) or out (for minus figure) the amount stamped on face of pinion, install gauge in axle housing (with differential carrier removed) seating gauge rings on differential bearing posts, add or remove shims between pinion front bearing and shoulder in housing until micrometer pointer contacts face of adapter installed on pinion (adapter must be used on all hypoid gears). Shims furnished .011", .012", .015", .018", .060" and 3/16" thick. **Pinion Setting Note**—In production, pinions are not ground on face and have definite tooth for pinion setting gauge measurements. When using gauge, measure to blank tooth (between tooth which has factory inspection mark of letter and number, and tooth with + or — mark) and again at opposite side of pinion (place adapter on pinion with blank tooth up and then with blank tooth down) and average these two readings to determine shim correction.

Standard Pinion Setting

Model	Micrometer Setting
40, 50, 60, 70	.379"
90	.203"

Ring & Pinion Gear Meshing Note—On 4.4 ratio axle, marked gear teeth must be meshed together (ring gear marked '26', pinion tooth marked '18'). This precaution should be taken on all gear sets where number of ring gear teeth and number of pinion teeth have common divisor (44 and 10 on this 4.4 axle).

Differential Bearing Adjustment:—Remove adjusting nut locks, mark adjusting nuts, loosen right bearing capscrews ¾ turn and tap cap lightly to free nut, back off right hand nut slowly and note point where bearing race stops turning with nut, mark this new position, return nut to original position and repeat check. Race should stop turning at same point and number of notches nut has been turned is 'notches tight' of old setting. Correct setting is 2-2½ notches tight (all models). If bearing did not turn when nut backed off, turn up adjusting nut until bearing starts to turn and note number of notches that bearing was free. If this free setting not caused by bearing wear (lapped free or race turning on hub of case), equalize adjustment by turning each adjusting nut up 1 notch from point where race started to turn. Tighten both bearing capscrews and replace bearing locks.

Ring Gear Backlash Adjustment. When adjusting ring gear backlash, make certain that differential side bearing adjustment not disturbed (back off one nut and tighten opposite nut equally). Check bearing adjustment. If adjusting nuts marked before dismantling, setting nuts up to original marks should give correct ring gear position.

NOTE—Backing off one nut, and tightening other nut, one notch will change backlash .004-.005".

BUICK REAR SUSPENSION

Used On:

SERIES 41-40,40A,50,60,70,90 (1941)

TYPE:—Coil springs of same design as used on 1940 car models with special shock absorber mounting as follows:

Shock Absorbers (40, 50, 60, 70). Shock absorbers are double-acting, parallel cylinder Delco type mounted on brake backing plate by two bolts (remove wheel and brake drum to remove shock absorbers). Upper end of shock absorber arm link is attached to inner face of frame side rail (link extends through slot in lower flange).

Shock Absorbers (90)—Delco double-acting, end-to-end discharge type mounted on frame side rail and linked to axle housing at spring seat.

SERVICING:—No adjustment required except that spring heights ('Trim' dimension) must be correct to insure satisfactory shock absorber action and special directions necessary to remove and replace springs.

Spring Removal:—Disconnect lower ends of shock absorbers at axle bracket, raise rear of car to distend springs, remove bolts in upper and lower spring cups (upper bolt has right hand thread, lower bolt threaded up through spring bracket has left hand thread).

Spring Installation:—Make certain that insulator is in place between top of spring and frame, turn spring cups on bolts so that they are snug in end coils, see that rubber insulator in place on upper bolt, tighten bolts securely.

Trim Dimension:—At curb weight, distance from top of axle housing at center to raised flange on bracket on lower face of frame rail slightly forward of axle housing should be 5⅛-6" (40,50,60,70), 5½-6¼" (90). Replace rear spring if trim dimension too small (see Spring data).

Rear Spring Specifications—Springs have identical ends at top and bottom. Spring part number stamped on coil near end and spring paint marked for identification as follows:

Standard Springs

Car Model	Spring Part No.	Color Mark
41, 51, 51C	1317788	Blue-Yellow
46, 56	1321053	Blue-Brown
46S, 56S, 56C, 66	1317790	Blue-Aluminum
49	1315231	Red-Red
61, 71, 71C	1317789	Blue-Red
66S, 76S, 76C	1317788	Blue-Yellow

Optl. High Springs

41, 51, 51C	1312433	Yellow
46, 56	1315105	Brown
46S, 56S, 56C	1315047	Aluminum
61, 71, 71C	1310399	Red
66, 66S	1315047	Aluminum
76S, 76C	1312433	Yellow

Heavy Duty (Overload) Springs. If spring bottoms excessively when loaded, a spring from a heavier model car may be installed providing that new spring does not increase trim dimension (above) more than 1". Make certain that same type spring installed on both right and left sides of car. For use with trailers or when heavy loads carried in rear compartment (not to exceed 500 lbs. in addi-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

tion to normal passenger load of 500 lbs.), special rear springs may be installed as follows:

Heavy Duty Rear Springs

Car Model	200 Lb. Overload	300 Lb. Overload
41, 51, 51C	1310399	1315233
46S, 56C, 56S, 66	1312433	1315231
46, 56	1315047	1315231
49	1315233	
61, 71, 71C	1315231	1315233
66S, 76C, 76S	1310399	1315233
90, 90L, 91, 91F	1304586	1305366

Rear Stabilizers:—When installing stabilizer links, nuts should be tightened down to ends of threads which should compress rubber grommets to over-all length of 1 11/16" (to outer face of metal cup on each end of grommet), adjust nuts as required to secure this dimension. Over-all free length of new grommets is 7/8".

NOTE—Rear Stabilizer not used on Model 90.

Rear Radius Rod:—Tubular type attached to brackets on right hand axle spring seat and on frame at left side. Rubber bushings used at each end.

CADILLAC HYPOID TYPE

Used On:

SERIES 41-60S, 61, 62, 63, 67, 75 (1941)

TYPE:—Hypoid gear. Same design as used on 1940 car models with pinion bearing adjusting spacer as follows:

Pinion Bearing Adjusting Spacer—Compressible steel spacer is installed on pinion shaft between pinion bearing cones. Tightening of rear universal joint companion flange nut causes the spacer to "buckle" and pre-loads bearings.

SERVICING & OVERHAUL:—Differential carrier assembly should be serviced by replacement. Manufacturer recommends that no attempt be made to disassemble axles further than removal of carrier assembly or replacement of pinion shaft and axle shaft oil seals.

CHEVROLET TWO-SPEED (DOUBLE REDUCTION) TRUCK TYPE

Optl. Equipment On:

CHEVROLET TRUCK, ALL MODELS (1941

SERVICING, OVERHAUL & ADJUSTMENT:—All operations same as 1939-40 Two Speed Rear Axle except as noted below. *See 'Chevrolet (Double Reduction) Two Speed Type' Rear Axle article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete instructions and note following new data:*

Axle Shaft Gasket—Soft aluminum gasket used between wheel hub and axle shaft flange. Install new gasket whenever axle shafts are removed.

Wheel Bearing Servicing—Wheel bearings installed in same manner as on regular full-floating axle (see preceding article).

Shifter Sleeve Installation Note—Shifter sleeve has three tapered teeth which must line up with poppet balls and springs in shaft. These tapered teeth are unevenly spaced on the shaft and in the sleeve (two groups of 8 teeth and one group of 9 teeth between these tapered teeth). Determine the 9 tooth group on the sleeve and the 9 space-between-teeth group on the shaft and mesh these together. CAUTION—If sleeve and shaft not meshed in this manner, one or more lock balls will be out of position in the sleeve.

CHEVROLET SEMI-FLOATING PASS. CAR & TRUCK TYPE

Used On:

PASSENGER CAR TYPE

MASTER DELUXE AG, SPECIAL DELUXE AH ('41)

TRUCK TYPE

HALF-TON MODELS AJ, AK (1941)

¾ TON MODELS AL, AN ('41)—SEE NOTE.

1940 SPECIAL SERVICE NOTES:—Axle Vent Production change on 1940 Truck—On first ½ & ¾ Ton trucks, if lubricant pumps out through vent in torque tube, remove torque tube vent and plug this opening with pipe plug, provide new vent by drilling 1/8" hole through first axle housing cover bolt to left of top bolt and inserting 1/16" cotter pin through this hole (bend cotter pin to prevent it loosening in service).

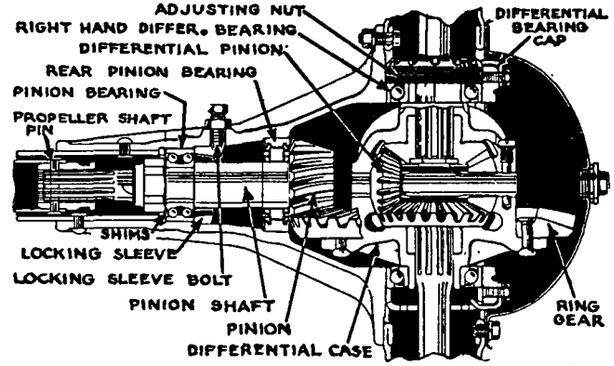
CAUTION.—If late type differential carrier and torque tube assembly (without vent) is used with first type Axle housing (without vent), a vent must be provided by drilling 11/32" hole in top of axle housing 8" to left of vertical centerline of axle. Thread hole with 1/8" tapered pipe tap, install #3652364 regular production vent. Use extreme care to remove all metal chips when drilling and tapping this hole. NOTE—If desired, the vent may be provided by drilling the housing cover bolt as directed above instead of installing this regular vent.

PASSENGER CAR AXLE NOTE:—Axles may be identified by prefix letter of serial number stamped on top right hand side of differential carrier as follows: Std. 4.11-1 Ratio—'AG' or 'AJ'. Optl. 3.73-1 Ratio—'AH' or 'AP'.

TRUCK AXLE NOTE:—Truck axles are same design as those used on Passenger Car Models except they are of heavier construction. Truck axles also have improved lubrication system as follows:

Pinion Bearing Lubrication—Drilled passage in differential carrier provided for greater oil flow to front (double row ball) pinion bearing. Oil retainer installed in carrier in front of rear (roller) pinion bearing retards oil return to axle housing so that front bearing operates in an oil bath.

¾ Ton Models—These axles are new Hotchkiss Drive type with rear universal joint yoke bolted on forward end of propeller shaft and oil seal installed in axle housing (no torque tube used). Serviced in same manner as other Axles except for oil seal data (see below). Disregard data on torque tube and propeller shaft when servicing these models.



TYPE:—Hypoid gear, semi-floating type with torque tube drive. Pinion integral with shaft which is splined and pinned in bushing in rear end of tubular propeller shaft. Pinion shaft mounted on double row ball bearing (front) which takes thrust in both directions, roller bearing (rear) which takes radial load only. Rear bearing does not have inner race and is assembled directly on shaft. Differential assembly mounted on 'barrel' type roller bearings with adjusting nut under bearing cap at outer end of each bearing.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .005-.007" (Passenger Cars), .005-.008" (Trucks). Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equally. See Differential Bearing Adjustment and Pinion Setting below.

Axle Shaft Removal. Remove wheels, take out two 'Zipon' nuts mounting brake drum on the axle shaft flange and remove drum. Remove axle housing rear cover, take out pinion shaft screw, withdraw pinion shaft, lift out axle shaft spacer block. Push shafts in toward center of axle, remove 'C' washer at inner end within differential side gears, withdraw axle shaft. When replacing shaft, check endplay.

NOTE—Axle shafts are of unequal length. Install longer shaft on right hand side.

New Axle Shaft Installation. Wheel hub bolts are press fit in axle flange and must be installed in new shafts (these bolts hold oil deflector assembly on flange). Coat new gasket with heavy shellac or paint, install gasket and oil deflector on flange lining up oil holes (extra center hole of three closest together should be lined up with notch in flange, oil pocket in deflector should also line up with this notch), insert special wheel bolts and force heads

down to deflector, peen shoulder on bolts into countersink around bolt holes in flange (this is very important). Check shaft endplay.

Axle Shaft Endplay (Passenger Cars)—Controlled by spacer assembled on differential pinion shaft between inner ends of axle shafts. Endplay should be from a Free Fit to .014" max. Spacer blocks now furnished in three types providing four sizes as follows: Narrow—1.0105". Medium—1.0195" and 1.0295", Wide—1.0345". These dimensions taken across ground faces of block and block should be installed with these ground faces toward axle shaft ends. NOTE—Medium block ground on all four sides and may be installed either way to secure either of these two sizes.

Axle Shaft Endplay (Trucks)—Same as for Passenger Car (above) except that spacer blocks furnished in two types for three sizes as follows: Narrow—1.1485", Wide—1.1575" & 1.1675" (this block ground on all four sides and may be installed either way to secure both sizes).

Propeller Shaft Front Bearing. Consists of a bushing and leather oil seal seated against shoulder in housing at forward end of torque tube, and an additional bushing at the extreme end of the torque tube which engages the stub shaft of the universal joint. Both bushings are doweled in place. Replace bushings when clearance exceeds .010". To remove bushings (front bushing must be removed to take out rear bushing), drill out dowel pins, drive bushings out from rear end of torque tube. Install oil seal with open end of leather toward front, insert rear bushing, use J-968 bushing driver to seat bushing and oil seal firmly. Drill new dowel hole in bushing (being careful not to break through wall), coat dowel with Permatex to prevent oil leaks, peen dowel in place. Install new front bushing in same manner, using arbor to prevent damage to bushing while drilling dowel hole and installing dowel (bushing has very thin wall).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Front Propeller Shaft & Support Bearing (¾ Ton Truck):—Consists of an enclosed type shaft with front universal ball joint assembled on forward end, and special intermediate support bearing and front yoke for intermediate universal joint bolted on rear end. Support bearing is of the permanently lubricated and sealed type and is mounted in a rubber cushion in the support bracket sleeve.

Disassembly—Clamp universal joint yoke in vise, remove cotter pin and nut from rear end of shaft, tap yoke off shaft with soft hammer, remove bearing dust shield. Wet rubber cushion (to soften soap used when cushion assembled), clamp support bracket in vise and move shaft housing from side to side to work cushion out of support, then slide cushion off housing, remove front universal ball retainer over rear end of housing. Remove bearing retainer snap ring in rear end of housing (compress ends of ring with pliers), use brass drift to drive propeller shaft and bearing out through rear end of housing. Press bearing off shaft in arbor press. CAUTION—Do not wash bearing in gasoline or attempt to lubricate it (bearing is permanently lubricated and sealed). Remove oil seal from housing only if seal being replaced (drive seal out toward front of housing). Soak new seal in light engine oil and install with free end or lip toward front end of housing.

Front Propeller Shaft Bushing—Consists of a thin wall bushing pressed in forward end of housing which engages front universal joint rear yoke. This bushing installed in same manner as Passenger Car type (see directions above).

Assembly—Press bearing on shaft in arbor press, assemble shaft and bearing in housing, seat bearing by tapping around outer race using soft drift, install snap ring. Install new cork packing in universal joint ball retainer (shellac cork in place), install retainer over housing, install rubber cushion on machined rear end of housing. Coat rubber cushion lightly with soft soap, assemble support bracket on cushion, install bearing dust shield and intermediate universal front yoke, tighten nut securely and install cotter pin.

OVERHAUL:—Pinion Bearing Assembly. To remove assembly from torque tube, loosen locknuts and take out retaining screws on side of housing, withdraw assembly from torque tube. To dismantle assembly, drill out head of rivet pin in propeller shaft, loosen pinion bearing locknut, disassemble pinion from propeller shaft. Use J-996 pinion bearing remover to press double row ball bearing from pinion shaft, remove locking sleeve or bearing retaining collar, remove lock ring from pinion shaft, take off roller bearing. Front double row ball bearing must have no perceptible endplay (new bearings may be .001" tight or have some drag). Assemble in reverse order making certain that lock ring installed on shaft ahead of roller bearing (to prevent rollers creeping) and that locking sleeve installed with beveled edge toward pinion. Tighten bearing locknut securely and stake nut into slot in shaft. Use new rivet pin when assembling pinion and propeller shaft and rivet both ends of pin securely. Make certain that pinion setting shims installed in housing (see Pinion Setting below), insert propeller shaft assembly and drive it down to seat bearings (use drift in hole in end of pinion, do not drive on pinion teeth). Make certain that locking sleeve down against bearing, install the three tapered lockscrews, tighten screws evenly and securely, tighten locknuts.

Pinion Bearing Assembly (½ Ton)—When assembling pinion bearings on shaft, install rear roller bearing and lock ring, then thread pinion front bearing oil retainer on shaft with bevel of large diameter of retainer toward pinion, assemble bearing lock sleeve with bevel side toward pinion, install front double row ball bearing and bearing retainer nut. All other assembly and adjustment instructions same as for passenger car models.

Pinion Bearing Assembly & Oil Seal (¾ Ton)—Assemble pinion bearings in same manner as ½ Ton (above) except that rear universal joint yoke and oil deflecter (pressed on outer diameter of yoke) must be installed on pinion shaft and yoke retaining nut must be securely tightened before ring gear and pinion adjustments are made. When installing new pinion bearing retainer oil seals, soak seal thoroughly in light engine oil before it is installed.

Pinion Setting:—Pinion position controlled by shims installed in housing ahead of front bearing. Standard assembly .033" shim thickness (one .015" shim, one .018" shim) and should be used for new gears. Shims furnished .012", .015", .018", .021" thick and shim pack can be varied from .030" to .036".

Differential Bearing Assembly:—Use special puller to remove bearings from differential case hubs (notches provided in case for puller so that pressure applied to inner races only). Use J-994 bearing replacer to install bearings. When installing differential assembly in carrier (third member), make certain that marks on bearing caps and carrier line up.

Differential Bearing Adjustment:—With carrier or third member assembly out of axle housing, tighten differential bearing cap screws until lockwashers are just flattened, turn right hand adjusting nut up until it is just snug, then turn nut additional 1-2 notches to locking position, tighten bearing cap screws securely and install adjusting nut locks.

Ring Gear Backlash Adjustment. To set up differential assembly for correct backlash when installing assembly in carrier, turn left hand adjusting nut in slowly until all backlash between ring gear and pinion taken up (revolve ring gear while making this adjustment), then back adjusting nut off one notch. Adjust differential bearings by turning right hand adjusting nut as directed above. This setting should give correct backlash of .005-.007" (Passenger Cars), .005-.008" (Trucks). If backlash not correct, back off one adjusting nut, turn up opposite nut equal amount.

Ring Gear Replacement:—Run-out of differential case flange must not exceed .001" with ring gear removed. When installing ring gear, use guide pins in alternate bolt holes to position gear while bolts are being installed, use new lockwashers under bolt heads, tighten all bolts evenly and securely and lock with wire. Ring Gear run-out .004" maximum.

CHEVROLET FULL-FLOATING HYPOID TRUCK TYPE

Used On:

1½ TON & CAB-OVER-ENGINE TRUCKS (1941)
SCHOOL BUS MODEL YT (1941)

NOTE—Two axle ratios used (5.43-1 and 6.17-1) and each type may be identified by prefix letter of part number stamped on top surface of top rib on right side of differential carrier casting as follows: 5.43-1 Ratio—'AT' or 'AW', 6.17-1 Ratio—'AR' or 'AS'.

TYPE:—Hypoid Gear, full floating type. Similar to design used on previous Chevrolet Truck models (Hypoid Gear, full-floating type) except that Hotchkiss Drive is now used with rear universal joint yoke bolted on pinion shaft and new pinion bearing retainer and oil seal bolted on forward end of differential carrier (no torque tube used).

SERVICING:—Gear Adjustment—Pinion not adjustable. Backlash should be .005-.008" (see Differential Bearing Adjustment below).

Axle Shaft & Wheel Bearings:—Wheels mounted on double barrel type roller bearings on outer end of axle housing and axle shafts can be removed without disturbing bearings. To remove axle shaft, bend lugs of lock plate away from bolt heads (on axle shaft flange on wheel hub), remove eight ½" capscrews, remove and discard lock plate. Install two 7/16x14 capscrews in tapped holes in flange (between mounting screw holes), turn these screws up evenly to loosen axle shaft, remove axle and aluminum gasket. When installing shaft, use new aluminum gasket and new lock plate, tighten capscrews evenly and securely, then bend lock plate lugs against screw heads.

Wheel Bearing Adjustment—Remove axle shafts (above), remove adjusting nut locknut and lock (within wheel hub), use special wrench J-870 (see Note below) and turn adjusting nut up tight, then back nut off 45° (⅛ turn). Rotate wheel hub by hand to make certain that it turns freely. Install lock and see that tangs line up with slots in adjusting nut, bend lock tang into slot in nut. Install and tighten outer locknut, bend lock tang into notch in nut. Re-install axle shaft. NOTE—Wheel bearing adjusting nuts on later trucks do not have slots extending entirely across face of nut (slotted at outer edge only) and the J-870 wrench must be reworked for use on these models as follows: Remove wrench handle, mount wrench body in lathe and machine inner ends of wrench lugs to inside diameter of 2½".

Wheel Bearing Assembly—To remove wheel bearings, remove axle shafts (above), take out locknut, lock, adjusting nut, remove hub and drum assembly. Install clamp on brake cylinder. Use puller J-918 to remove inner bearing and oil seal. To remove outer bearing from wheel hub, tap outer race to relieve tension on snap ring, remove snap ring on inside of hub, use long ⅛" punch inserted through mounting screw holes in end of hub and tap outer race out of hub (inner race and roller assembly will come out with outer race—use extreme care to tap on outer race only and to drive race out evenly). Wash bearings in gasoline and pack roller assemblies with #2½ cup grease. To replace outer bearing, place inner race, roller assembly and outer race on wheel hub with thin edge of outer race toward hub, use bearing replacer J-872-1 in an arbor press and press bearing in hub just far enough so that snap ring can be installed, install snap ring, then tap bearing out against snap ring (use driver J-872-3 inserted through mounting screw holes and tap on outer race only). To install inner bearing, use special driver J-872-4 to press outer race in against seat (install with wide side of race toward hub), install inner race and roller assembly. Press oil seal in place using oil seal replacer J-872-2 in arbor press, stake oil seal in place by prick punching at three equally spaced points on edge. Install wheel hub and drum assembly (turn wheel to seat bearings) and adjust bearings (above).

NOTE—Oil slinger on rear axle housing must be installed with special tool J-973 so it will be correctly positioned in relation to slinger in wheel hub. Always install new slinger whenever removed.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Front Propeller Shaft & Support Bearing:—Consists of a tubular shaft with integral rear yoke for front universal joint at forward end, intermediate support bearing and front yoke for intermediate universal joint bolted on shaft at rear end. Support bearing is of the permanently lubricated and sealed type and is mounted in a rubber cushion in the support bracket sleeve.

Disassembly—Clamp universal joint yoke in vise, remove nut on rear end of shaft with 1½" socket wrench, tap yoke off shaft. Wet support bearing rubber cushion (to soften soap used when cushion assembled), clamp support bracket in vise and move shaft from side to side to work cushion out of support, then pull rubber cushion off bearing by hand. Use special puller J-1619 (clamp puller in vise) to remove bearing from shaft, tap dust shields off outer race of bearing. CAUTION—Do not wash bearing in gasoline or attempt to lubricate it (bearing is permanently lubricated and sealed type).

Assembly—Press outer dust shield on outer race of bearing, install forward inner dust shield on shaft with offset away from bearing, drive bearing on shaft (use universal joint yoke as a driver), install rear inner dust shield with offset away from bearing, install rubber cushion on bearing. Coat outer surface of cushion lightly with soft soap, slide support bracket over cushion. Install universal joint yoke (turn yoke 90° from front universal yoke on opposite end of shaft) and securely tighten yoke nut.

OVERHAUL:—Disassembly—Remove ring gear thrust pad, adjusting nut locks, bearing cap bolts and lock-washers, take off bearing caps (bearing caps now piloted on carrier by sleeve type dowels to maintain alignment), lift differential case and ring gear assembly out of carrier. Take out bolts mounting pinion bearing retainer and oil seal on forward end of carrier, remove pinion and shaft assembly from carrier.

Pinion Bearing Assembly:—Remove cotter pin, nut and washer on end of pinion shaft, remove universal joint and bearing retainer and oil seal from shaft. To remove rear pinion bearing, remove lock ring, use special press plate J-1453 to press shaft and pinion out of bearing (CAUTION—make certain that raised portion of plate against bearing inner race to avoid damage to bearing). Use special pinion bearing remover J-1439 (6 tooth pinion), J-1440 (7 tooth pinion) installed over pinion so that it engages inner race of double row ball bearing, press shaft and pinion out of bearing. Wash all parts in gasoline, inspect for wear or damage. To reassemble, press front double row ball bearing on shaft making certain that extended portion of bearing inner race is toward gear teeth (CAUTION—If bearing not installed in this manner, rapid wear and gear failure will result). Press rear bearing on end of shaft with chamfered side of inner race toward pinion and install lock ring. Install pinion bearing retainer and oil seal on end of pinion shaft, install gasket and universal joint yoke so that it contacts inner race of bearing, install flat washer and nut, tighten nut with force of 160-280 ft. lbs. and install cotter pin.

Bearing Retainer Oil Seal—If oil seal being replaced, soak new seal in light engine oil for one hour, install felt packing in bottom on seal recess, then install seal with open end of leather toward pinion bearing and press seal down against felt packing.

Pinion Setting:—Pinion position not adjustable. Double row bearing should be seated against shoulder in carrier and is retained by torque tube IMPORTANT SERVICE CAUTION—This double row bearing must be installed with the ⅛" projection of the bearing inner race extending **back toward the pinion.** If bearing incorrectly installed, it will cause excessive backlash and early failure of the ring and pinion gears.

Differential Bearing Assembly:—Bearings are press fit on differential case hubs. Use special puller to remove bearings (puller fingers must fit in notches in case so that pressure applied to inner races only). Mark differential case halves before dis-assembly to insure reassembling in same position—this is very important. Remove twelve ½" bolts holding case halves and ring gear together, lift off case cover, remove differential pinions and side gears, tap ring gear off case with soft-faced hammer. When reassembling, oil pinions and side gears and install in left side of case, assemble right side of case being careful to line up marks made before disassembly, install guide pins in two opposite bolt holes (guide pins can be made up of two #2652253 ring gear screws with heads removed and end slotted to permit removal). Make certain that ring gear seat on case is clean and not burred, install ring gear on guide pins, install bolts in all holes (except guide pin holes), tighten all bolts evenly and securely until ring gear face is flush with flange on case, remove guide pins, install remaining bolts and tighten all bolts. Use special driver to install differential side bearings on case hubs and see that wide side of inner race is toward case. Check differential case run-out which must not exceed following maximum figures: .004" at ring gear pilot on case and face on which ring gear is bolted, .007" on back of ring gear after gear bolted in place.

Differential Bearing Adjustment:—When installing differential assembly in carrier, make certain that bearing cap marks line up with marks on carrier, tighten bearing capscrews until lock washers just flatten out, screw both bearing adjusting nuts up until snug to seat bearings. Back off right hand adjusting nut, tighten left hand nut until all clearance or backlash between ring gear and pinion is just taken up, then back off adjusting nut two notches to locking position (slot in nut in line with lock). Tighten right hand adjusting nut solidly, back nut off until free of bearing, then tighten right hand adjusting nut until all play in bearing is taken up, and then tighten nut one to two notches more to locking position, tighten bearing cap screws and install adjusting nut locks. Check backlash.

Ring Gear Backlash Adjustment—If backlash not correct after setting up bearings as directed above, loosen left hand adjusting nut one notch and tighten right hand nut one notch (if backlash less than .005-.008"), or loosen right hand nut one notch and tighten left hand nut one notch (if backlash greater than .005-.008"). In making any backlash adjustment both adjusting nuts must be turned an exactly equal number of notches (in opposite directions) to avoid disturbing bearing adjustment.

Ring Gear Thrust Pad Adjustment:—Examine bronze tip on ring gear thrust pad and replace if worn. To adjust, tighten thrust pad adjusting screw until bronze tip engages back of ring gear lightly (turn gear while making adjustment), then back screw off 1/12 turn, hold screw from turning and tighten locknut. This adjustment will give clearance of .005-.007" between thrust pad and ring gear.

CHRYSLER HYPOID TYPE

Used On:
CHRYSLER, C28 ROYAL & WINDSOR (1941)
CHRYSLER, C30 SARATOGA&NEW YORKER ('41)
DE SOTO, MODEL S8 (1941)
DODGE, MODEL D19 (1941)
PLYMOUTH, MODELS P11, P12 (1941)

TYPE:—Hypoid gear, semi-floating type with Hotchkiss drive. Same design as used on corresponding 1940 car models.

SERVICING:—Gear Adjustment—Paint gears to check mesh. Ring & Pinion Gear backlash should be .006-.010". When making this adjustment (by backing off one differential bearing adjusting nut and tightening opposite nut), note new differential bearing adjustment data below.

Axle Shaft Endplay—Should be .003-.008". When dismantling axle, make certain that shims installed between backing plate and axle housing flange are saved and replaced when axle reassembled. If new shaft installed, adjust shim thickness for correct endplay as noted above (adjust equally at both wheels).

Axle Shaft Replacement—To remove axle shaft, remove wheel, axle shaft nut, hub and brake drum assembly (use Puller C-319), block brake pedal at toeboard, disconnect brake line at wheel cylinder. Remove nuts on studs holding oil seal and brake support on axle housing, remove and save shims from between support and housing (see Axle Shaft Endplay below), withdraw axle shaft using special puller C-158. To remove bearing from shaft, use puller C-293.

Wheel Bearing Oil Seal—Use special Seal Puller C-358 to remove seal and special drift C-201 or C-202 to install seal.

OVERHAUL:—Disassembly—With differential carrier out of axle housing, mark both bearing adjuster nuts and bearing caps so that they can be installed in correct position and approximately right adjustment, remove bearing cap screws, lift out differential and ring gear assembly. To remove pinion, take off nut on end of pinion shaft, use tool C-452 to pull pinion flange. Pull pinion out through rear end of carrier housing. Use special puller C-293 to remove bearing from pinion shaft. Reassemble in same manner using tool C-496 to install pinion flange.

Pinion Bearing Adjustment—Bearings should be .0015-.0025" tight (draw or tension). Use dial indicator to check with sufficient shim stock installed between spacer and front bearing cone so that pinion shaft has some endplay, then remove shim stock equal to this measured endplay plus .0015-.0025" so as to provide this amount of draw or tension when installed on car. Universal joint flange must be in place on shaft and pinion shaft nut must be tight when checking bearing adjustment. Oil seal need not be installed until after bearing adjustment completed (use special drift C-359 to seat oil seal in carrier bore).

Differential Side Gear Assembly—Differential pinion gear shaft retained by pin (except 7 Pass. cars), lock screw (7 Pass. cars). Gears can be dismantled (with ring gear removed) by taking out this pin or lockscrew, pulling out shaft and removing thrust block (on center of shaft). When reassembling, make certain that this thrust block installed on shaft with spacer on shaft between block and each differential pinion, and that thrust washers installed in back of each differential pinion and side gear. Clearance between side gears and pinions

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

should be .004-.012" (controlled by thrust washers in back of gears).

Pinion Setting—Controlled by washer (Chrysler Six, DeSoto, Dodge, Plymouth except 7 Pass. cars), shims (Chrysler Eight & Chrysler Six, DeSoto, Dodge, Plymouth 7 Pass. cars) between pinion and pinion shaft rear bearing cone. Shims or washer thickness should be varied to secure correct pinion mesh (pinion assembly must be dismantled to remove or install these washers or shims. If old pinion being re-installed, use same washer and shims as removed when axle disassembled. If new Ring and Pinion gears being installed, install washer or shim thickness of .090" and then check gear mesh and pinion bearing adjustment.

Differential Bearing Adjustment—When checking adjustment, both bearing adjusting nuts should be tightened sufficiently to seat bearing cups solidly against rollers, then back off adjusting nuts to relieve strain and tighten until assembly turns with slight drag. NOTE—Adjustment can be checked by setting up dial indicator to measure bearing post 'spread' as adjusting nuts are tightened. With correct adjustment, bearing support pedestals should spread or move out .008-.010" measured at the bearing caps.

Ring Gear Backlash Adjustment—When adjusting backlash, note number of notches one adjusting nut is backed off and tighten opposite nut exactly same number of notches to avoid disturbing bearing adjustment.

CHRYSLER C33 HYPOID TYPE

Used On:

CHRYSLER, C33 CROWN IMPERIAL (1941)

TYPE:—New design Hypoid Gear, semi-floating type with 'barrel type' differential case. Differential case has open end on right hand side through which differential gears are installed, this opening then being closed by cap which is threaded into case and locked by pin extending through drilled hole in case and cap. Right hand differential case side bearing is seated on shoulder on cap. Pinion shaft bearing cups are seated against shoulders in carrier bore and front bearing cone seats against shoulder on shaft (spacer washer between cone and shaft shoulder), no tubular shaft spacer being used. Special ring gear thrust pad and adjusting screw is installed in left hand side of differential carrier so as to contact back of ring gear.

SERVICING:—**Gear Adjustment**—Paint gears to check mesh. Backlash should be .006-.010". Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equally. See Differential Bearing adjustment below.

Axle Shaft Replacement—To remove shaft, remove wheel, axle shaft nut, hub and shaft key (use special hub puller C-476. Disconnect brake line, remove stud nuts holding oil seal and backing plate on housing, remove oil seal, backing plate, and wheel bearing adjusting shims (save shims and reinstall when assembling). Use shaft puller C-158 to pull shaft and bearing (if bearing to be removed from shaft use puller C-293). When installing new shaft, adjust shim thickness at each wheel equally for desired endplay of .003-.008" (shims furnished .010", .0125", .015", .030" thick). NOTE—Shims must be installed or removed equally at each wheel to maintain correct position of spacer block on differential pinion shaft at inner end of axle shafts.

Wheel Bearing Oil Seal—Use special puller C-358 to remove oil seal washer from housing, special drift C-201 to install new seal washer.

OVERHAUL:—**Disassembly**—Mark differential bearing adjusting nuts and bearing caps to insure replacement in correct position. Remove adjusting nut locks, back off adjusting nuts, take out bearing cap screws, remove bearing caps, lift differential assembly out of carrier. Remove drive pinion shaft nut, pull universal joint drive pinion flange, remove pinion and shaft through rear end of carrier. Use special puller C-293 to remove rear bearing cone from pinion shaft. Use special puller C-358 to remove pinion oil seal from carrier bore, special drift C-359 to install new seal. NOTE—Seal can be serviced without disassembling carrier assembly. New seals should be soaked in thin oil for 30 minutes and leather should be worked by rolling with smooth bar until it is pliable.

Pinion Bearing Adjustment:—Bearing should be .0015-.0025" tight (draw or tension) with pinion shaft nut securely tightened. To check bearings, mount dial indicator so as to measure pinion shaft endplay. Install pinion bearing washer of sufficient thickness between front bearing cone and shoulder on pinion shaft so that shaft has measurable endplay (pinion assembly must be dismantled to change this washer). Then install washer which is thin enough to take up all endplay plus .002" to provide proper draw or tension on bearings (subtract measured endplay plus .002" from first washer thickness to find correct final washer thickness).

Differential Gear Assembly:—To disassemble differential gears, use special puller C-293 and puller blocks to remove right hand differential bearing from differential case cap. Drive cap locking pin through hole in case so that pin is entirely within cap. Heat differential case in boiling water, then unscrew cap from right hand end with special spanner wrench. Drive differential pinion shaft locking pin out of case, withdraw pinion shaft and all differential gear parts. When reassembling, make certain that thrust washers installed behind each differential pinion and side gear and that thrust block installed on center of pinion shaft with spacer between block and each pinion. Peen edge of differential pinion shaft locking pin hole after pin installed to prevent pin working out in service. Heat differential case in boiling water before installing end cap, tighten end cap securely, drill new hole through cap and case and drive new groove pin in hole until flush (do not reuse old groove pins). Clearance between differential pinions and side gears should be .004-.012" and is controlled by thrust washer thickness installed in back of gears.

Differential Bearing Adjustment:—When installing carrier assembly, turn adjusting nuts up to marks made before disassembly, then check bearing adjustment as follows: Tighten both bearing adjusting nuts sufficiently to seat bearing cups solidly against rollers, then back off nuts to relieve strain and tighten until differential assembly turns with slight drag or bearing support pedestals 'spread' .008-.010" as measured at bearing caps (use dial indicator to measure this spread or outward movement of pedestals as nuts are tightened). Replace bearing and adjusting nut locks and tighten bearing cap screws securely.

Ring Gear Backlash Adjustment—When adjusting backlash, note number of notches one adjusting nut is backed off and tighten opposite nut exactly same number of notches to avoid disturbing bearing adjustment. Make certain that ring gear thrust pad has sufficient clearance to permit ring gear movement and adjust thrust pad after correct backlash of .006-.010" is secured.

Ring Rear Thrust Pad Adjustment:—Clearance between thrust pad and back face of ring gear should be .006-.008". To adjust, loosen locknut on thrust pad stud (on left hand side of carrier housing), turn stud up finger tight, then back stud off slightly less than ⅛ turn, tighten locknut.

FORD (PASSENGER CAR) & MERCURY

Used On:

FORD, MODEL 11A PASS. CARS (1941)
FORD, 1NC, 11C, 19C COMMERCIAL (1941)
MERCURY, MODEL 19A (1941)

TYPE:—Spiral Bevel gear, ¾ floating type with Torque Tube drive. Same design as used on corresponding 1940 models.

SERVICING:—**Gear Adjustment.** Backlash should be .012" maximum (Ford), .010" maximum (Mercury). Controlled by gasket thickness between pinion housing (axle center section) and right and left axle housings. See Differential Bearing Adjustment below.

Axle Replacement. Axle shafts must be removed from inner end after axle dismantled and differential case bolts removed (side gears integral with shafts). When installing axles see that free travel or play at wheels keyway does not exceed .010" or endplay exceed .015". If play excessive, check differential gears for wear (pinion clearance .005" maximum).

Propeller Shaft Forward Bearing:—In forward end of torque tube behind speedometer drive gear. Two types used (use B-4645-A roller assembly with split sleeve, 68-4645 with small rollers with solid sleeve). Use special puller SV-245 to remove solid sleeve from torque tube. Install new grease retainer (use tool A-310) with sharp edge of leather toward universal joint (old grease retainer will be damaged by sleeve removal).

Propeller Shaft Center Bearing:—In torque tube at center. On types with solid propeller shaft, front bearing sleeve must be removed before center bearing can be removed with SV-186 tool (see above).

OVERHAUL:—**Disassembly.** Remove speedometer driven gear assembly. Remove snap ring on forward end of propeller shaft, withdraw speedometer drive gear and thrust washer. Take out flange mounting screws at rear of torque tube, withdraw propeller shaft from tube toward rear. Drive out rivet in coupling, disconnect propeller shaft from pinion. Use AATA-1 driver to remove pinion assembly from housing, BV-92 puller to remove bearings.

Pinion Bearing Assembly:—Assemble bearings on pinion shaft (see Note below), tighten bearing locknuts so that bearing cup turns on cones with heavy drag. Heat housing (use approved heater or immerse housing neck in boiling water or hot oil for 1-2 minutes), install outboard bearing (use BV-94 driver), then with housing still hot install pinion assembly making certain that bearing cup is against shoulder in housing. Check pinion bearing adjustment only after installed in housing.
NOTE—Only bearings marked 'P' on end of cone should be used next to pinion

Pinion Bearing Adjustment:—Use approved gauge ABV-129 to check bearing adjustment. The setting must be 17-20 in.lbs. (straddle mounted pinions). To

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

adjust, tighten pinion bearing nut until correct gauge reading secured (check only after pinion assembly installed in axle housing), then tighten locknut securely and turn lockwasher ears over on nuts.

Differential Bearing Adjustment:—Assemble axle with one 18-4035-A gasket (.008-.010" thick) between right and left hand axle housing and pinion housing. Check bearing adjustment by rotating both axle shafts simultaneously (rotating one shaft will not turn differential assembly). Differential assembly should turn with a heavy drag. If clearance too great, replace gasket between right hand axle housing & pinion housing with B-4035-BR gasket (.004-.005" thick). Then check gear for backlash.

Ring Gear Backlash. Use dial indicator mounted to show pinion gear shaft movement with ring gear stationary. Backlash .012" (Ford), .010" (Mercury) maximum. Adjust by increasing or decreasing thickness of gasket between left hand axle housing and pinion housing. Total gasket thickness must not be changed in order not to disturb bearing adjustment (increase or decrease right hand gasket thickness equally).

FORD FULL-FLOATING TRUCK TYPE

Used On:

FORD, ALL 4 CYL., V8 '85' & '95' TRUCKS ('41)

TYPE:—Spiral bevel, full-floating type with Hotchkiss drive. Same design as used on corresponding 1940 models.

¾ & 1 Ton Truck—Axle used on these models same as on other trucks except that pinion bearing sleeve (double bearing cup) is not flanged and is retained in housing by separate bearing retainer which is bolted on front end of housing with separate grease retainer assembly.

SERVICING:—Gear Adjustment—Backlash should be .004-.016". No adjustment provided.

Axle Shafts—Shafts can be removed without disturbing wheels and hubs as follows: Take out two screws in hub cap, remove cap. Remove nuts on 8 studs on axle shaft flange, turn two bolts (located between studs) in evenly to loosen axle shaft flange from hub. Then back off these two bolts, strike sharp blow on center of axle shaft flange to loosen locking cones on studs. Remove locking cones, pull axle shaft out. When installing shaft, see that gasket in place under axle shaft flange, back off loosening bolts sufficiently to allow axle shaft to seat on hub, install locking cones on studs, tighten stud nuts evenly and securely, then tighten the two loosening bolts just enough to prevent their loosening in service.

Wheel Bearing Adjustment—Remove axle shaft (above), remove outer locknut, lockplate, and grease retainer (except on ¾ and 1 Ton). Turn inner bearing adjusting nut up tight, then back nut off ⅛ turn, install lockplate being certain that locking pin in nut engages notch in lockplate (except ¾ & 1 Ton), bend lockplate tang against nut (¾ & 1 Ton). Install outer locknut and tighten securely. Rotate wheel by hand and see that it turns freely. Re-install axle shafts.

Wheel Bearing Assembly—To disassemble wheel bearings, remove axle shafts, remove outer locknut, grease retainer, lockplate and inner adjusting nut, remove wheel hub. Remove snap ring in inner end of hub, use puller BB-139 to remove grease retainer, remove inner bearing roller assembly, use puller BB-148 to remove inner bearing cup from hub. Remove outer bearing roller assembly from hub, use puller BB-148 to remove bearing cup from hub. Re-install parts in same manner using BB-150 to install both bearing cups in hub and to install grease retainer. Make certain that grease retainer snap ring installed in inner end of hub. Adjust bearings after hub installed on axle (see above).

OVERHAUL:—Disassembly—Remove axle shafts and wheel hubs, take out capscrews holding left hand axle housing on right hand housing, remove left hand housing using care not to lose thrust pin and plate. Withdraw ring gear and differential assembly from housing (differential side bearing roller and cone assembly will come out on differential case hubs, bearing cones will remain in housing halves). Remove and service pinion assembly and differential assembly as directed below.

Pinion Bearing Assembly (Except ¾ & 1 Ton):—To disassemble, take out screws mounting grease retainer and pinion sleeve flange on forward end of axle housing, remove grease retainer and pinion assembly. To disassemble pinion, remove locknut, lockplate, adjusting nut, and washer on end of pinion shaft, use tool AATA13 to remove pinion from sleeve (rear bearing roller and cone will come out with shaft). Use BB-142 to remove and install this rear bearing on pinion shaft. If bearing cups to be removed from sleeve, use puller BB-143 to remove cups and BB-144 press to install bearing cups. Use puller BB-145 to remove outboard bearing from axle housing and BB-147 to install this bearing. Reinstall pinion and bearings in sleeve in this same manner, tighten adjusting nut until force required to turn pinion shaft is 12-16 inch lbs. (use ABV-129 gauge which reads directly in in. lbs.). Tighten locknut securely and see that lockplate tangs turned over against both nuts.

¾ & 1 Ton Models—Pinion bearing sleeve is not flanged and pinion assembly should be removed from axle housing with special driver (after grease retainer and bearing retainer removed). Bearings are removed from pinion shaft as an assembly with special puller (after pinion bearing adjusting nut and locknut have been taken off). When installing bearings, install rear bearing first, then install front bearing and bearing sleeve or cone as an assembly. Heat axle housing before installing pinion assembly and check bearing adjustment only after assembly installed in housing. Force required to turn shaft should be 16-20 inch lbs. (same as other models) and is adjusted in same manner .

Pinion Setting:—Pinion position not adjustable. If pinion mesh with ring gear not correct, replace all worn parts.

Differential Assembly:—To disassemble take out capscrews holding right hand half of differential case on left hand half, remove right half of case and lift out differential gears, pinions and pinion shaft. To remove differential bearing rollers and cones from differential case hubs, use special puller AATA1. Replace these bearings with tool BB-147. Use BB-148 to remove bearing cups from axle housing and BB-149 to install these bearing cups. Ring gear is serviced as a unit with the differential case and should not be removed. Differential bearings are not adjustable and use of additional gaskets between axle housing halves to control bearing adjustment is not recommended.

Assembly Note:—When reassembling axle, see that thrust block and thrust pin not worn and properly installed in left hand axle housing, use one 61-4035 gasket (¾ & 1 Ton), BB-4035 gasket (Others) between axle housing halves.

FORD TWO-SPEED TRUCK TYPE

Optional Equipment On:

FORD TRUCKS, ALL MODELS (1941)

SERVICING & OVERHAUL:—All specifications and service operations same as for 1939 model. *See 'Ford Two Speed Truck Axle' article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete data and note following new specifications:*

Pinion Bearing Setting—Force required to turn pinion shaft should be 8-12 inch lbs. (measure with ABV-129 gauge).

HUDSON SPIRAL BEVEL TYPE

Used On:

SIX, MODELS 10, 11, 12, 18 (1941)

EIGHT, MODELS 14, 15, 17 (1941)

NOTE:—Axles used on all models are identical except for axle shaft diameter and wheel bearing size. Axle shafts on Models 10P & 10T are 1 5/16". All other six cylinder models (with 3x5" engine) and Eight Cylinder models have larger 1⅜" axle shafts and correspondingly larger wheel bearings.

TYPE:—Spiral bevel gear, semi-floating type with Hotchkiss drive. Same design as used on 1940 models (see Note above) except for change in pinion setting shim pack as follows:

Pinion Setting Shims—Differential carrier dimensions changed so that normal shim thickness in back of rear pinion bearing is .006" (was .056"). See Pinion Setting below.

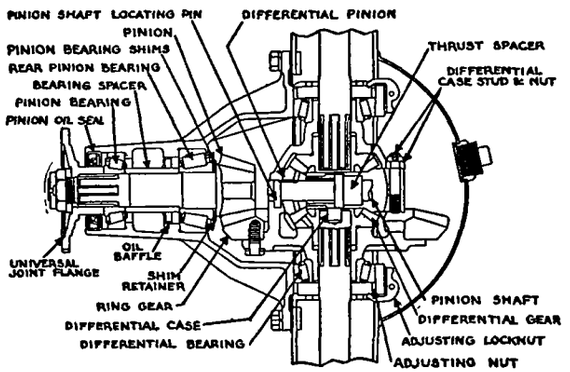
SERVICING:—Gear Adjustment—Paint gears to check gear mesh. Pinion position controlled by shims between pinion and rear bearing cone. Backlash should be .0005-.0035". Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equally. See Pinion Setting and Differential Bearing Adjustment below.

Axle Shaft Replacement. Remove rear wheels, axle shaft nut and washer, use wheel puller to remove hub and brake drum assembly (do not use knock-out type puller). Take off 4 nuts on wheel bearing adjusting cap, remove cap and bearing adjusting shims, use puller J-352 to remove shaft and bearing assembly. Use bearing Remover J-1301 to remove bearing cone and rollers from shaft, tool J-358-H to re-install bearing.

Oil Seals—Use oil seal replacer tool J-353-1 to install new oil seal in bearing adjusting cap. Use tool HM-555 to remove old seal from axle housing, and use driver J-353-2 to install new seal assembly.

Axle Shaft Thrust Button Renewal. Thrust button consists of hardened steel plug in inner end of axle shaft. To remove button, grind end flush with shaft, center punch button and drill through center with 11/32" drill, tap hole with ⅜-16 tap, screw in 3/8-16 capscrew, place head of screw in vise and tap end of shaft with soft hammer to remove button. Drive new button into place in shaft.

Axle Replacement. When replacing axle or adjusting wheel bearings remove shims equally at each wheel of .002-.004". Adjust each wheel separately so that thrust spacer on differential pinion shaft is centered on shaft.



OVERHAUL:—Disassembly—Mark differential bearing caps and adjusting nut positions (to facilitate reassembly), remove bearing caps and lift out ring gear and differential assembly. Use special puller J-354-A to remove differential bearing cones from

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

differential case hubs making certain that puller fingers installed in notches in case so that they engage bearing cone. Remove bolts and lockwashers to remove ring gear. To disassemble differential gears, remove cotter pins and nuts and separate right and left halves of differential case. When reassembling differential gears, select thrust washers of correct thickness so that gears have no appreciable endplay when installed (it should be possible to turn gears by hand by grasping axle shafts). Install thrust washers with smooth side toward gears and rough side toward case.

Pinion Bearing Assembly:—To disassemble pinion and bearings from carrier, remove nut and washer on end of shaft, pull rear universal joint companion flange using puller J-456, withdraw pinion, spacer, and shims through rear of carrier. Use tool J-489 to remove oil seal from carrier, lift out front bearing cone, use tool HM-63 to remove bearing cones from carrier bore. Use tool J-1301 to remove rear bearing cone from pinion shaft. When reassembling, seat bearing cups in carrier with tool HM-64, insert front bearing cone, install new oil seal with replacer tool J-353-1 (see Note below), install pinion, spacer and adjusting shims (see

Bearing Adjustment and Pinion Setting below), install companion flange and tighten nut with torque wrench to 200 ft. lbs. while holding flange with special tool J-789.

Oil Seal Note—Two types used (with concave or flat outer surface). Both types installed in same manner but clearance must be maintained between edge of dust shield on companion flange and oil seal (will cause noise if there is contact at this point).

Pinion Bearing Adjustment—Re-install same pinion bearing adjustment shims between bearing spacer and front bearing cone, tighten pinion shaft nut securely with rear universal joint flange in place, check bearing adjustment. It should be just possible to turn pinion shaft with one hand. Add thin shim if bearings too tight. Pinion bearing endplay should be .000-.001".

Pinion Setting:—When reassembling pinion install same shim thickness between pinion and rear bearing cone to retain correct pinion position. Adjust pinion by adding or removing shims at this point. NOTE—Shim pack for 1941 axles is .006" (reduced from .056" shim pack used on previous models by change in carrier bore dimensions).

Differential Bearing Adjustment:—To set up bearings when installing differential carrier, tighten differential bearing cap capscrews finger tight, turn left hand adjusting nut in until all play eliminated between pinion and ring gear, then tighten right hand adjusting nut securely. Set up dial indicator to check gear backlash, back off left hand adjusting nut one half notch and tighten right hand nut equal amount until gear backlash is .0005-.0035". Tighten bearing capscrews securely on left hand adjusting nut, turn right hand adjusting nut in one additional notch to secure correct bearing pre-load of .009" bearing tension. Tighten right hand bearing capscrews securely and install locks on both nuts.

Ring Gear Replacement:—With gear removed, run-out of gear mounting flange on differential case should not exceed .002". When installing gear, see that gear and case are clean and smooth and not nicked or burred. Use lockwashers on all gear mounting screws and tighten all screws uniformly and securely.

LINCOLN HYPOID TYPE

Used On:

ZEPHYR & CONTINENTAL MODEL 16H (1941)
CUSTOM MODEL 168H (1941)

TWO-SPEED AXLE NOTE:—Optl. on all models. This axle is Columbia Two-speed type. See separate article for data on this type.

TYPE:—Hypoid gear, ¾ floating type with Torque Tube drive. Same design as used on corresponding 1940 models.

SERVICING:—Replacement Exchange Axles — Furnished in assemblies consisting of differential housing (axle housing center section) with pinion gear installed (set up for correct bearing adjustment and ring gear mesh) and mated ring gear. This assembly is Part No. 86H-4020 and can be used on 86H ('38), 96H ('39), 06H ('40) as well as on 1941 Models 16H and 168H.

OVERHAUL:—Limited to installation of new Differential Housing Assembly (see Exchange Axle data above) and reassembly of right and left axle housings. When assembling axle, note the following points:

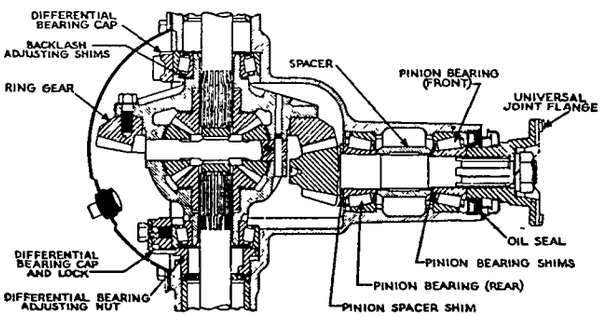
Ring Gear Backlash—Should be .002-.004" and should be set at figure etched on the particular ring gear being used (ring and pinion gears mated and it is very important that these individual clearance figures be used for each set of gears).

Pinion Bearing Adjustment—Correctly set at factory and should not be disturbed in service. Bearing pre-load should be 18-20 in. lbs. (force required to turn pinion shaft with bearings properly adjusted). Use ABV-129 gauge to measure this setting.

Differential Gear & Ring Gear Backlash Adjustment—Controlled by gasket thickness between axle housing halves and differential housing. Normal gasket thickness for correct backlash and differential bearing adjustment is .005-.008" at each side of differential housing. Gasket furnished in three thicknesses as follows: .008-.010" (86H-4035-A), .004-.006" (86H-4035-B), .013-.018" (86H-4035-C). Vary thickness at left hand housing to adjust backlash (keep total thickness for both sides same to avoid disturbing differential bearing adjustment), vary thickness at right hand side to adjust differential bearings (do not change thickness on left hand side to avoid disturbing backlash).

NASH 4160 & 4180 HYPOID TYPE

Used On:



AMBASSADOR SIX, MODEL 4160 (1941)
AMBASSADOR EIGHT, MODEL 4180 (1941)

TYPE:—Hypoid gear, semi-floating type with Hotchkiss drive. Same design as used on corresponding 1940 models.

NOTE—Axles on all models similar except for size. May be identified by diameter of tubes (pressed and welded in center casting). Tubes are 2½" (4160), 3" (4180) in diameter.

SERVICING:—Gear Adjustment—Paint gears to check mesh. Backlash should be .005-.007". Adjusted by adding or removing shims located between shoulder on differential case and cone of left hand differential side bearing. See Pinion Setting and Differential Bearing Adjustment below.

Axle Shaft Replacement—To remove shaft with wheel and hub removed, take off nuts on bearing retainer (rear brake support plate), remove oil seal, retainer plate, bearing adjusting shims, then pull axle shaft and bearing assembly. When installing shaft, add or remove shims between retainer plate and axle housing flange to secure desired axle shaft endplay of .003-.006".

OVERHAUL:—Disassembly—With axle shafts out, remove rear housing cover, mark adjusting nut on right hand differential side bearing to insure replacing in same position, back adjusting nut off, remove bearing cap bolts and bearing caps, lift differential assembly out. To remove pinion, remove nut on end of pinion shaft, pull universal joint flange, press pinion out of housing toward rear. Remove pinion shaft oil seal, use special pullers to remove bearing cups from housing.

Pinion Bearing Assembly:—Bearing adjustment controlled by shims located on pinion shaft between spacer and forward bearing cone. When installing pinion, install correct washer and shim pack for correct pinion mesh (see Pinion Setting below) on shaft against pinion, install rear bearing cone and bearing spacer. Install sufficient shims on shaft in front of spacer to insure positive endplay of shaft when installed in housing, install front bearing cone, universal joint companion flange or special tool (splined sleeve) and tighten nut on shaft securely. Then check bearing adjustment as directed below. NOTE—Do not install oil seal until after bearing adjustment has been made.

Pinion Bearing Adjustment—Use dial indicator to check pinion shaft endplay with companion flange nut securely tightened (oscillate shaft in both di-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

rections while applying end pressure to insure bearings seated). Disassemble pinion shaft and remove shims from between spacer and front bearing cone equal to the observed endplay **plus .003"** to insure correct bearing pre-load or set (.003" tight).

Pinion Setting:—Pinion mesh controlled by washer or washer and shim pack installed on shaft between pinion and rear bearing cone. Use Pinion Setting Gauge SE-534-A to determine washer thickness for each pinion as follows: Make certain that rear bearing cup properly seated in housing, coat bearing with film of light oil, install bearing and bearing cone, roll bearing back and forth while applying pressure to insure bearing being seated. Install rectangular checking block on bearing cone, install gauge and make certain that end discs seated in differential bearing bores in housing (tap lightly with hammer to insure seating). Turn gauge micrometer until end of shaft just contacts ground surface of checking block while pinion bearing is being rotated under pressure. Subtract gauge reading from .408" which will give correct washer thickness for standard pinions (marked by figure =0 following the set number stamped on the end of the teeth). If pinion marked by + or — figure, subtract shims (if pinion marked +), add shims (if pinion marked —) equal in thousandths to the figure following this plus or minus mark. Install washer and shims equal to this final figure on the shaft between the pinion and the rear bearing cone

Pinion Adjusting Washer Note—Pinion Adjusting Washers furnished in six thicknesses as follows: .117", .118", .119" and .129", .130", .131". These washers can be used with not more than three .003" shims to make all necessary thicknesses from .117" to .140". CAUTION—Install washer with chamfered side toward pinion and shims (if used) between the washer and the bearing cone.

Pinion Setting without Gauge—If new pinion being installed and pinion setting gauge not available, note washer and shim thickness used for old pinion, secure standard washer thickness for this housing by adding (if pinion marked +), subtracting (if pinion marked —) shims equal to figure following this plus or minus mark on the old pinion, finally correct this standard washer thickness in accordance with new pinion marking as directed under Pinion Setting above.

Differential Gear & Bearing Assembly:—To dismantle differential gear assembly, drive out pin in differential pinion shaft, remove shaft, axle shaft thrust block, pinions, side gears and thrust washers. When reassembling, make certain that thrust washers installed in back of each side gear and pinion and that thrust block is installed on pinion shaft (this block transmits thrust from one shaft to the other).

Differential Bearing Adjustment:—With lock on right hand bearing adjusting nut removed, and bearing cap loosened so that adjusting nut can be turned, turn adjusting nut up until all bearing endplay is just removed and notch on nut is in line with lock on cap, then tighten adjusting nut two notches additional for correct bearing pre-load. Tighten bearing cap bolts and install adjusting nut lock.

Ring Gear Backlash Adjustment—Check backlash with dial indicator at several points around ring gear. If backlash not within limits of .005-.007", dismantle axle, remove left hand differential side bearing, add or remove shims on hub behind bearing (add shims to decrease backlash, remove shims to increase backlash), reassemble axle, readjust differential bearings.

NASH '600' HYPOID TYPE

Used On:

AMBASSADOR '600', MODEL 4140 (1941)

TYPE:—Hypoid gear, semi-floating type with Torque Tube Drive and coil springing. Axle is similar in design to that used on other Nash models except for Torque Tube and Propeller Shaft data as given below.

SERVICING & OVERHAUL:—This model disassembled and serviced in same manner as axles used on other Nash models after Torque Tube and Propeller Shaft have been removed and these units are serviced as directed below.

Torque Tube & Propeller Shaft Removal—With axle assembly removed from car, unscrew Trunnion Bracket from forward end of torque tube, remove rubber boot. Remove nuts from bolts holding truss rod clamp bracket and from truss rods, remove clamp bracket and truss rods (locating screw in upper half of bracket positions center bearing in torque tube). Take out bolts mounting torque tube on rear axle housing, remove torque tube, withdraw propeller shaft and center bearing assembly. NOTE —Universal joint (front) and sleeve (rear) are press fits on ends of propeller shaft (see propeller shaft data below).

Torque Tube & Propeller Shaft Assembly—Reverse disassembly directions given above. Make certain that nuts on both truss rods are drawn up uniformly and securely locked so that torque tube and axle are properly aligned and that locating screw in clamp bracket upper half enters hole in center bearing so that bearing is properly positioned in torque tube. Adjust trunnion bracket when axle installed in car as directed below.

CAUTION—Stamped steel slinger which is press fit on universal joint rear yoke must not interfere with shoulder on front face of trunnion bracket (slinger prevents dirt entering torque tube at this point but noise will result unless some clearance exists).

TORQUE TUBE TRUNNION BRACKET:—On front end of torque tube. Must be properly installed and adjusted before rear axle and torque tube assembly installed on car. Follow adjustment and installation instructions listed below. Propeller shaft center bearing must also be lubricated at 5000 mile intervals. See data following.

Trunnion Bracket Adjustment—Position trunnion bracket on torque tube (with assembly out of car) so that distance between front face of trunnion bracket and rear face of flange at rear end of torque tube is 70 15/16" (regular transmission), 63 7/16" (with overdrive), plus or minus 1/16". After bracket properly positioned, adjust clampscrew on underside of bracket to remove all excess clearance between threads on bracket and tube without setting up excessive friction. Bracket must be free to move on threaded tube. Lock clampscrew nut with cotter pin. Rubber boot must be installed behind bracket to protect threads on tube from road dirt. Threaded parts require no lubrication except at time of assembly. Lubricate these parts sparingly.

Trunnion Bracket Installation—After bracket adjusted as directed above, torque tube and rear axle assembly can be assembled to transmission as follows: Thread 2 special trunnion bracket studs (with tapered ends to rear) on trunnion bracket and lock with nuts and lock washers. Assemble plain stamped steel retainer, rubber cushion block (with small extension to front), steel retainer with pilot flange over extension on rubber block, on each stud. Install torque tube and rear axle assembly with trunnion bracket studs passing through holes in transmission (or overdrive) rear bearing retainer. Assemble steel retainer with pilot flange to rear, rubber block with extension to rear, and plain steel retainer on front end of studs. Tighten retainer nuts on studs until rubber cushions held under slight tension. Lock nuts with 'palnuts'.

Propeller Shaft Center Bearing Lubrication—Bearing must be lubricated every 5000 miles as follows: Take out locating screw on top side of upper clamp on torque tube at front end of truss rods, fill with light engine oil to overflowing in screw hole, replace screw.

NASH '600' REAR SUSPENSION

Used On:

AMBASSADOR '600', MODEL 4140 (1941)

TYPE:—Consists of special coil springs installed in pockets in frame cross-member at upper end and in spring seats bolted to axle housing by clamp bolts at lower end. Direct acting shock absorbers are installed within springs (clamped in spring seat at lower end, bolted in extension bracket on frame cross-member at upper end) and extend through holes in cross-member. A transverse radius rod is bolted to frame cross-member (right side), and to axle housing (left side) with rubber cushions at each end.

SERVICING:—No servicing operations required. See separate Shock Absorber article for shock absorber servicing data and spring data below.

SPRINGS:—Same spring used on right and left sides of car. Spring is Nash Part No. 3107067.

OLDSMOBILE REAR SUSPENSION

Used On:

SIX, MODELS 66, 76, 96 (1941)

EIGHT, MODELS 68, 78, 98 (1941)

TYPE:—Coil spring type with support arms. Design changed from type used on 1940 car models as follows:

Spring & Support Arm Axle Mounting—Mounting consists of an insulator bracket on the axle housing, insulators installed in upper and lower faces of bracket, insulator cups on outer ends of insulators, and spacer extending through entire assembly. This assembly is clamped between spring mounting plate (top) and support arm (bottom) by two bolts. Lower end of coil spring is clamped on this top spring mounting plate by the rear bolt (bolt threads into lower spring clamp).

Coil Springs—Spring are larger in diameter but shorter length than 1940 types.

Shock Absorbers—Shock absorbers now mounted on brake backing plates and linked to frame.

SERVICING:—Spring Removal—Disconnect brake hose at axle, disconnect propeller shaft at rear universal joint and remove, disconnect shock absorber arms from links. Remove upper spring bolt and axle housing rear insulator bolt (this bolt threads into lower spring clamp and anchors lower end of spring). Raise car to remove weight from spring, remove spring and upper insulator washer. CAUTION—Although rear springs can be removed by raising rear end of car until flexible brake connection is just taut (without disconnecting brake line), this method not recommended and brake line should be disconnected (bleed lines when re-connected).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Spring Installation:—Spring must be installed with curled end of small diameter end coil at bottom (if both ends curled, spring may be installed either end up—some springs may have straight end which must be installed at top). Install spring with curled end of coil to rear and 1/16" to right of center-line through support arm. With spring in position, install insulator washer on top of spring and spring clamps in upper and lower end coils (lower clamp has grommet nut, upper clamp does not have nut which is located in frame side rail). Turn clamps so that they grip end coils snugly (clamps are cam shaped—assembly will be facilitated if clamps taped to spring). Line up holes in clamp and frame, lower car slightly to hold spring in place, install upper clamp bolt, thread rear insulator bolt up through insulator assembly and in to lower spring clamp, tighten both clamp bolts securely. CAUTION—See that spring clamps are seated snugly in springs and that spring does not ride on raised portion of mounting plate.

Axle Housing Insulators & Bolts:—See 'Spring & Support Arm Axle Mounting' description above for insulator assembly details. Upper and lower insulator halves are different sizes (upper half is longer) and must not be interchanged. Insulators are marked by words 'upper' and 'lower' molded in the rubber. Front axle housing insulator bolt is 5¾" long with right hand thread and should be installed with hexagon head at top. Rear bolt is 6" long with left hand thread and should be installed with hexagon head at bottom (bolt threads into lower spring clamp, no separate nut being used).

CAUTION—Both insulator bolts should be tightened uniformly. Do not tighten either bolt without tightening other bolt evenly.

Support Arms:—To remove support arms, proceed as directed for spring removal above (do not disturb spring upper clamp bolt), removing both axle housing insulator bolts, push lower end of coil spring out of the way and remove insulators, plates, and cups. Free forward end of support arm from frame and remove arm. Install arm in same manner.

Track Bar:—Mounted on rubber bushings at each end. To remove bar, remove nut on stud at axle end, pry forward on arm to loosen serrated bolt, disconnect bar from frame cross-member bracket, rotate plate on frame end of track bar and remove bar. Install track bar in same manner.

REAR SPRINGS:—Spring part number stamped on outside of one end coil (will not be visible when installed on car) and are paint marked for identification as follows:

Rear Spring Specifications

Car Model	Wire Diameter	Paint Mark
66,68 5 Pass.	.568"	Green & White
66,68 2 Pass.	.540"	Green & Orange
76,78,96,98 5 Pass.	.587"	Green & Yellow
76,78,96,98 2 Pass.	.580"	Green & Aluminum

OLDSMOBILE HYPOID TYPE

Used On:

SIX, MODELS 66, 76, 96 (1941)

EIGHT, MODELS 68, 78, 98 (1941)

AXLE IDENTIFICATION NOTE:—Ring and pinion gear ratio stamped on upper outer surface of differential carrier of all axles for identification purposes as follows: 41:10—4.1-1 Ratio, 43:10—4.3-1 Ratio, 41:9—4.55-1 Ratio, 39:10—3.9-1 Ratio, 41:12—3.42-1 Ratio, 40:11—3.63-1 Ratio. Refer to car model 'M' page for Std. and Optl. axle ratios on each model.

TYPE:—Hypoid gear, semi-floating type with Hotchkiss drive. Same design as used on corresponding 1940 car models.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Backlash should be .004-.008". Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equally. See Pinion Setting and Differential Bearing Adjustment below.

Axle Replacement. Wheel mounting flange integral with axle shaft. To remove shafts, remove wheel (wheel nuts on left side of car have left hand threads), take out two bolts holding brake drum on axle shaft flanges, remove drums, take off nuts on 4 bolts holding backing plate on axle housing flange, remove static collector, pull axle shaft bearing retaining plate away from backing plate (be careful not to disturb backing plate which will damage brake lines), withdraw axle shaft and bearing assembly using puller J-942, replace one nut to hold backing plate in position.

Wheel Bearings & Oil Seal. Bearings are shielded type (lubricated at factory) and pressed on axle shaft against shoulder at wheel end of shaft. Remove bearings only when new bearings installed (see Bearing Collar Note below). To remove, use tool J-947-2 (to prevent bursting of race), and plate J-947-1 and press bearing off shaft in arbor press. Install new bearings in same manner using tool J-947-3 and plate J-947-1 to insure pressure being applied to inner race only. Before installing shaft, make certain that double feather edge of leather oil seal is in good condition or install new seal with oil seal installing tool J-1049 and coat outer rim of seal with Permatex or white lead to prevent oil leaks.

Bearing Collar Note—On all models, collar is installed on shaft behind bearing. Collar must be split with chisel before bearing removed. After new bearing installed, press new collar on shaft firmly against bearing with tapered end toward bearing.

Wheel Bearing Note—New wheel bearings have .008-.010" sideplay and should not be replaced unless sideplay exceed .015" or bearings are noticeably rough.

OVERHAUL:—Disassembly. Mark both differential bearing adjusting nuts and caps to insure correct reassembly, remove bearings caps and adjusting nuts, lift differential assembly out of carrier. Remove rear universal companion flange nut, use tool J-962, remove flange from shaft, press pinion shaft back through front ball bearing inner race and remove, remove and save shims installed on shaft directly back of this bearing. Do not remove snap ring on pinion shaft directly in front of pinion gear (this gear prevents rear bearing rollers from creeping on shaft). Remove rear bearing rollers (rollers cannot be removed singly on new bearings), use tool J-983 to pull outer race out of housing, take out 3 lockscrews in housing, remove locking sleeve, tap front bearing out.

Pinion Bearing Assembly:—Push front ball bearing into housing and tap lightly on outer race to seat bearing against shoulder in housing, insert bearing retainer sleeve (tapered end toward rear) and lock sleeve firmly in place against ball bearing race by turning up the three cone-pointed lockscrews evenly and securely and tightening lockscrew locknuts. Use tool J-940 to drive rear roller bearing outer race in place in carrier, coat the 14 bearing rollers with heavy grease and install in place in bearing race. Install correct shim thickness for each pinion against shoulder on pinion shaft (see Pinion Setting directions below), make certain that roller lock ring in place on pinion shaft at pinion end, install pinion in carrier guiding shaft through washer at forward end of carrier. Install companion flange, tighten flange nut (hold flange in vise). NOTE—Front ball bearing has slight 'pre-load' when new and should be replaced if any endplay noted. Pinion shaft should not be worn more than .0007" (compare with unworn shaft ahead of bearing). If any radial play noted at pinion when assembled, gears will not run quietly (replace roller bearing if shaft not worn).

Pinion Setting:—Standard shim thickness for each carrier indicated by marking on flange as follows: D5—.049", D4—.048", D3—.047", D2—.046", D1—.045", C—.044", S1—.043", S2—.042", S3—.041", S4—.040", S5—.039". 'D' indicates bearing shoulder deeper than standard, 'C' on center or standard, 'S' shallower than standard. These figures correct for standard or unmarked pinions. When pinion marked by plus or minus figure on face, shims should be added (+ sign), subtracted (— sign) from this standard shim thickness equal (in thousandths) to the figure following this plus or minus sign. Pinions which are unmarked do not require any correction to be made to the shim thickness as indicated by the carrier marking. Shims furnished in four sizes and colored for identification as listed below (use combinations of shims for all required thicknesses).

Shim Thickness	Part No.	Color
.012"	499528	Plain
.014"	503063	Blue
.015"	499529	Copper
.018"	499530	Plain

Pinion Marking Note—Standard pinions (which require no shim correction) are unmarked.

Differential Gear & Bearing Assembly:—To remove the differential side bearings, use tool HM-986 installed so that pressure applied to bearing cone only. Use J-941 driver to install bearings. To dismantle differential gears and pinions, take out pinion shaft lockscrew and shaft, revolve pinions until aligned with openings in case, withdraw pinions, remove side gears and thrust washers. Install in same manner (thrust washers may be installed with either face toward gears).

Differential Bearing Adjustment:—Adjusting nuts and bearing caps should be marked before disassembly to insure correct replacement. To adjust bearings, loosen each bearing cap bolt one-half turn, remove locks, back off right hand adjusting nut until bearing outer race stops turning with nut, turn nut up until race begins to turn, tighten 3 notches, then repeat adjustment and turn nut up 3-4 notches from point where bearing race begins to turn with nut, tighten bearing cap bolts and replace locks.

Ring Gear Backlash Setting—When installing differential assembly, back off right hand adjusting nut four turns, then turn left hand adjusting nut up until all backlash removed from between ring and pinion gears, finally back off left hand adjusting nut exactly four notches. Adjust differential bearings by turning right hand adjusting nut as directed above. This procedure should give correct backlash of .004-.008".

PACKARD HYPOID TYPE

Used On:

CLIPPER, MODEL 1951 (1941)
'110' SIX, MODEL 1900 (1941)
'120' EIGHT, MODELS 1901, 1A (1941)
'160' SUPER 8, MODELS 1903, 3A,4,5 (1941)
'180' CUSTOM SUPER 8, 1906,7,8 (1941)

TYPE:—Hypoid type. Same design as used on corresponding 1940 car models. Ring Gear Support Roller used on Super Eight '160' and '180' models only.

SERVICING:—Gear Adjustment—Backlash should be .003-.005". Adjusted by backing off one differential side bearing adjusting nut and tightening opposite nut equally. See Differential Bearing Adjustment below. Pinion position not adjustable (for gear mesh adjustment).

Axle Shaft Replacement—To remove axle shaft, remove wheel and hub, disconnect brake lines, remove backing plate and wheel bearing adjusting shims, pull axle and bearing assembly. When installing axle shaft, select shim thickness between housing flange and backing plate on each side so that total axle shaft endplay is .004-.007".

OVERHAUL:—Pinion Bearing Adjustment—Pinion bearing pre-load controlled by compressible spacer on pinion shaft between bearings and adjusted by tightening universal joint companion flange nut. Bearing pre-load must be adjusted whenever this nut is loosened or disturbed. To adjust, tighten nut until spacer is felt to buckle, then check pull required to rotate pinion shaft. If less than 25 inch pounds (5 lbs. pull on end of 5" lever arm), tighten nut further until pre-load is 25-30 inch pounds. Special scale, Packard ST-5087, may be used to check this pre-load. Adjust only with both wheels jacked up or differential carrier out to eliminate drag on pinion shaft.

IMPORTANT NOTE—If nut is tightened so that pinion bearing pre-load exceeds 30 in. lbs. when making this adjustment, install new sleeve and readjust as directed above. Do not back off nut to secure correct adjustment.

Pinion Assembly:—Pinion position not adjustable. Pinion mounted on taper roller bearings with bearing cups seated directly against shoulders in carrier bore and compressible spacer on pinion shaft between bearing cones. Bearing pre-load must be adjusted by compressing or "buckling" spacer whenever universal joint companion flange nut is loosened (see above).

Differential Gear Assembly:—Differential side gear endplay should be .002-.005". Adjust by installing thrust washer of correct thickness between side gear and differential case. These washers furnished in various thicknesses as follows: .031" (No. 330797), .036" (324583), .041" (324584), .046" (324585). When assembling differential gears, make certain that thrust block installed between inner ends of axle shafts (this block transmits thrust from one shaft to the other).

Differential Bearing Adjustment:—Bearings should be pre-loaded so that "spread" of bearing support pedestals of .010-.012" is secured. To make this adjustment, free adjusting nut locks. Loosen bearing cap nuts slightly to free adjusting nuts, make certain that there is some backlash between ring gear and pinion and clearance between ring gear and support roller (Super 8 only). Then back off right hand bearing adjusting nut until ring gear and differential assembly is loose in its bearings. Use accurate caliper and set caliper so that it will just slide over differential carrier with one leg resting on machined boss (adjusting nut lock pin boss) on each side of carrier **with .010" feeler between boss and caliper on one side.** Remove feeler, tighten right hand adjusting nut until caliper will just slide in place with the feeler removed (pedestals will have 'spread' this .010"). Correct pedestal spread should be .010-.012". Then adjust ring gear backlash and support roller clearance (Super 8 only).

Ring Gear Backlash Adjustment—After adjusting differential bearings (above), check ring gear backlash with dial indicator. If not within limits of .003-.005", adjust by backing off one differential bearing adjusting nut and tightening opposite nut exactly the same number of notches (to avoid changing bearing adjustment). Back off right hand nut to decrease backlash, left hand nut to increase backlash, use extreme care to tighten opposite nut exactly same amount. Then tighten bearing cap nuts and install adjusting nut locks.

Support Roller Adjustment (Super 8 Models):—Clearance between roller and back face of ring gear should be .005". To adjust, loosen lockscrew on roller stud sector plate, turn roller shaft (apply wrench to square end of shaft) until correct clearance secured, tighten sector plate lockscrew securely.

PACKARD REAR SUSPENSION

Used On:

'120' EIGHT, MODELS 1901, 1A (1941)
'160' SUPER 8, MODELS 1903, 3A,4,5 (1941)
'180' CUSTOM SUPER 8, MODELS 1906,7,8 (1941)

TYPE:—Consists of a special Lateral Stabilizer and Fifth Shock Absorber assembly used in conjunction with Direct Acting Rear Shock Absorbers. With exception of these new directing acting shock absorbers, design is same as used on corresponding 1940 car models (direct acting shock absorbers used on some 1940 models only).

SERVICING:—Shock Absorber Refilling—See separate articles on Delco, Monroe, and Houde (Fifth Shock Absorber) for capacity and filling data.

Fifth Shock Absorber Adjustment:—Check adjustment by mounting shock absorber in vise with arm pointing up, attach 50 lb. weight to bolt hole in end of arm, check time required for arm to make complete stroke (from extreme upper to extreme lower position with weight attached). Time should be 18 seconds minimum, 24 seconds maximum at room temperature. If outside these limits, remove plug on end of shaft (at arm), turn adjusting needle valve in or out as required and recheck performance. Standard setting of valve is ¼ turn out from inner seated position. Tighten packing nut to correct leakage at valve.

Rear Springs:—Rear springs are conventional leaf type but special interleaf inserts (3 different types used) are inserted in pockets at ends of leaves. Do not lubricate springs. When replacing springs, make certain that same insert combinations are used (different on various models).

PONTIAC HYPOID TYPE

Used On:

SIX, MODELS 41-24, 25, 26 (1941)
EIGHT, MODELS 41-27, 28, 29 (1941)

AXLE IDENTIFICATION NOTE:—Rear Axles and Propeller Shaft marked for identification by paint mark on end of right hand axle shaft (Rear Axles), band of paint at rear end (Propeller Shaft) as follows:

Car Model	Rear Axle	Color Marks Propeller Shaft
24,26 Std.	White	Yellow
25 Std.	Green	Green
27 Std.	Green	Red
28,29 Std.	White	Blue
3.9-1 Econ.(all)	Red	
4.55-1 Hvy.Duty(all)	Yellow	

TYPE:—Hypoid gear, semi-floating type with Hotchkiss drive. Same design as used on corresponding 1940 car models.

SERVICING:—Gear Adjustment. Paint gears to check mesh. Make certain that pinion flange nut, ring gear mounting screws, and pinion thrust bearing wedging screws are tight and that differential bearing adjustment is correct before checking gears. Backlash .003-.012". Adjust by backing off one differential bearing adjusting nut and tighten opposite nut equally. See Pinion Setting and Differential Bearing Adjustment below.

Axle Shaft Replacement. Wheel mounting flange integral with axle shaft. Bearings are special shielded type (lubricated at factory) pressed on axle shaft and held by retainer collar pressed on shaft. To remove shaft, remove wheel and brake drum, remove nuts from four bolts holding backing plate on housing, withdraw axle shaft (use puller J-942) taking care not to drag shaft on oil seal or to dislodge backing plate which will damage brake line. New bearings must be installed whenever removed from shaft. To remove bearings, use chisel to split retainer, press bearing off using special tool J-947 on outer race (pressure exerted on outer race which may burst if tool not used). Use same tool to install new bearing (pressure on inner race only) and retainer, pressing bearing on shaft against shoulder. Install shaft with left hand wheel studs on left hand side of car, shaft with right hand studs on right side of car. To renew oil seal, use tool J-943 to remove seal assembly, lubricate new seal with oil and coat outside rim of retainer with Permatex, use tool J-1049 to install seal assembly.
NOTE—If edge of brake drum flange is not flush with surface of shield on backing plate when installed, use sufficient gaskets, Part No. 499776 or 499930, installed between drum and axle flange for correct alignment.

Rear Axle Oil Seal Leak Correction—Oil may leak out around outer edge of axle shaft seal (between seal and bore of axle housing). To correct this trouble and to prevent oil leaking at this point in service, always make certain that Permatex, Permagasket or other sealing compound is spread in bore of housing before installing oil seal. Also use this same sealing material on both sides of rear brake oil deflector gasket when gasket is installed.

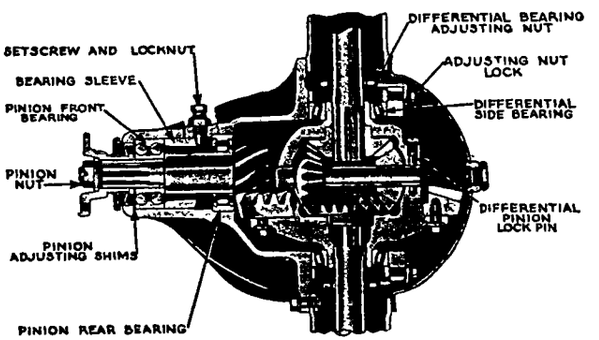
CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

OVERHAUL:—Axle Disassembly. Mark differential bearing caps and adjusting nuts (to insure correct replacement), remove bearing caps and adjusting nuts, lift out ring gear and differential assembly. Remove universal joint flange nut, use puller J-962 and remove flange. Press pinion out of carrier taking care not to damage pinion shaft threads or oil washer. No further disassembly required if pinion setting only being adjusted (see Pinion setting below). Loosen locknuts and remove three wedging screws on outside of housing, press bearings and locking sleeve out of housing using tool J-964.

Pinion Bearing Assembly:—Double row ball bearing should have no endplay (replace if endplay is perceptible). Roller bearing may have moderate amount of radial clearance on pinion shaft (no inner race). Bearings are drive fit in carrier housing. To install, drive ball bearing in against shoulder in housing (use tool J-939), install locking sleeve against bearing, back off locknuts and install locking sleeve wedge screws (oil screws before installing, tighten each screw one-half turn at a time, finish with full arm swing on 6-8" wrench), tighten locknuts, drive rear roller bearing in against shoulder in case (use tool J-940). Install rear bearing spacer on pinion shaft, select correct shim thickness for each carrier and pinion (See Pinion Setting below), install shims on pinion shaft, press pinion in carrier through bearings being careful that no pressure exerted on pinion teeth and that bearing rollers are not wedged against shaft. Install universal joint flange (at right angles to cotter pin hole), tighten pinion nut securely.

Pinion Setting:—Standard shim thickness for each carrier (indicated by mark on carrier flange) is as follows: D5—.049", D4—.048", D3—.047", D2—.046", D1—.045", 0—.044", S1—.043", S2—.042", S3—.041", S4—.040", S5—.039" ('D' indicates carrier bore deeper, 'S' shallower, than standard '0' dimension). To this standard shim thickness (which is correct for all unmarked or standard pinions), add additional shims (when pinion marked +), subtract shims (when pinion marked —) equal to amount of figure following this plus or minus mark on pinion (figure indicates shim thickness in thousandths). This total shim thickness will position pinion for correct mesh with ring gear. Shims furnished in four sizes and colored for identification as listed below (use combinations of these shims for all required thicknesses).



Shim Thickness	Part No.	Color
.012"	499528	Plain
.014"	503063	Blue
.015"	499529	Copper
.018"	499530	Plain

NOTE—Unmarked pinions are standard and indicate no correction need be made to indicated carrier flange shim thickness.

Differential Gear & Bearing Assembly:—To disassemble, take out locking screw (in case at end of pinion shaft), withdraw shaft, take out differential gears, thrust washers and pinions. Shaft must be removed before 'mountain-ratio' ring gear can be removed. Differential bearing inner race is .0012" press fit on hub (if less than this amount, replace case or copper-plate hub). To remove bearing, use puller J-986 (exert pressure on inner race only), install in same manner using tool J-941. Replace bearings if rough or pitted.

Differential Bearing Adjustment:—Remove adjusting nut locks, back off bearing cap nuts just enough to relieve strain so that nuts can be turned, mark nut and cap to establish original position, back off right hand nut slowly until bearing race just stops turning with nut (amount nut turned indicates 'notches tight' of nut. Turn adjusting screw in until race just starts to turn with nut, then tighten nut additional 1½ (minimum), 2½ (maximum) notches for correct bearing pre-load. Tighten bearing cap nuts securely and replace locks.

Ring Gear Backlash Adjustment—When adjusting differential bearings (above), if ring gear has slight backlash (.005"), equalize differential bearing adjustment by tightening each adjusting nut one notch (do not make entire adjustment at right hand nut). Backlash can be adjusted without disturbing differential bearing adjustment by backing off one adjusting nut and tightening opposite nut exactly same number of notches. Recheck bearing adjustment after adjusting backlash.

Ring Gear Replacement:—Replace ring and pinion gears as matched sets. Ring gear mounted on differential case by special heat treated alloy steel capscrews (do not use ordinary screws). Use new heavy type lockwasher on each screw each time screws are removed.

WILLYS HYPOID TYPE

Used On:

AMERICAR & PLAINSMAN, MODEL 441 (1941)

COMMERCIAL NOTE:—Rear axle on Pick-up and Panel Delivery is Spicer (Salisbury) Model 21-1. See Spicer Rear Axle article for data on this model.

TYPE:—Hypoid gear, semi-floating type with Hotchkiss drive. Pinion is integral with shaft and is mounted on taper roller bearings seated directly in housing with pinion bearing adjusting shims between front bearing cone and spacer, pinion adjusting shims in housing in front of rear bearing cup. Differential assembly is mounted on taper roller bearings with bearing and backlash adjusting shims installed between bearing cups and housing at each side.

SERVICING:—Gear Adjustment—Paint gears to check mesh. Backlash should be .006-.008". Adjusted by shifting shims from one differential bearing cup to the other (total shim thickness must be kept constant to avoid disturbing differential bearing adjustment). See Pinion Setting and Differential Bearing Adjustment directions below.

Axle Shaft Removal—Remove rear wheels, take off axle shaft nut and washer, pull hub and brake drum assembly (use puller), remove nuts on brake backing plate bolts, remove oil deflector, oil seal, bearing retainer, and bearing adjusting shims (Save shims for re-installation). Use puller to remove axle shaft and bearing assembly using extreme care not to disturb brake backing plate which would damage brake lines (or disconnect brake line and remove backing plate—if line disconnected, bleed brake lines when re-connected). Use puller to remove bearing from shaft.

Wheel Bearing Adjustment — When installing axle shaft, select shim thickness for installation between backing plate and bearing retainer so that axle shaft endplay is .004-.006". Wheel bearings designed to take thrust in one direction (transmitted through spacer on differential pinion shaft to opposite shaft in other direction).

OVERHAUL:—Disassembly—Remove differential housing cover, remove differential bearing caps, remove shims on right hand side of differential assembly first, then left hand shims (keep shims separate and install same shim pack at each point when reassembling axle). Take off nut and remove rear universal joint companion flange, use brass drift and drive pinion out of housing toward rear (rear bearing cone, rollers and bearing spacer will come out with shaft). Drive front bearing cup, rollers, and oil seal out toward front as an assembly. Drive rear bearing cup out toward rear in same manner.

Pinion Bearing Adjustment:—Bearing pre-load controlled by shims installed between front pinion bearing cone and bearing spacer. When installing pinion, install same shim thickness at this point as removed when old pinion disassembled, install universal joint companion flange, tighten pinion shaft nut securely and check bearing adjustment. Adjust by adding or removing shims furnished .004", .010", .030" thick.

Pinion Setting:—Pinion position controlled by shims installed on pinion shaft between pinion and rear bearing cone. Install same shim thickness as removed from old pinion at this point when installing pinion, check mesh. Add shims to move pinion in toward ring gear, remove shims to move pinion out away from ring gear. Shims furnished .004", .010", .030" thick.

Differential Bearing Adjustment:—Shims located between bearing cups and housing on either side. Furnished .180", .184", .188", .192", .196" thick. Select shims for correct bearing adjustment. When removing differential assembly, take off bearing caps, remove shims on right hand side first, install same shim thickness when reassembling.

Ring Gear Backlash Adjustment. Transfer shims from behind left hand differential bearing to right hand bearing to increase backlash, or from right to left to decrease backlash. Total shim thickness must not be changed to avoid disturbing differential bearing adjustment.

DELCO SINGLE ACTING TYPE

Car Model	Delco Model Number Front	Rear
Chevrolet AK,AJ ½ Ton	1430-CA,DA	1430-LA,MA
Chevrolet AL,AN ¾ Ton	1430-CA,DA	1431-X,Y
Crosley CB41	1201-G,H	1201-J,K

TYPE:—Single acting, hydraulic type. Same design as used on corresponding 1940 models.

SERVICING:—Disassembly. Use special fixture to clamp shock absorber on bench (clamping cylinder in vise will cause piston to bind). Take out relief valve plug, relief valve. Remove end cover screws, take off cover and gasket. Rotate arm, remove piston spring and intake valve. Do not remove shock absorber arm or shaft, replace shock absorber if bearing wear excessive or if packing washers worn so oil leaks around shaft (caused by operation with low oil level). Intake valve or intake and relief valve assembly can be removed from open end of piston after piston and spring have been separated.

Assembly. Use new gasket under cover and new lead washer under filler and relief valve plugs. Tighten cover screws securely to prevent leaks.

Filling. Remove filler plug, fill reservoir to level of plug hole with genuine Shock Insulating Fluid, replace plug, work arm up and down vigorously to work oil into cylinder, then remove plug and adjust fluid level so that it is level with lower edge of filler plug hole.

ADJUSTMENT:—Performance can be changed only by changing valves. Standard valve calibrations are shown in table below.

Car Model	Rebound Relief Valves Front	Rear
Chevrolet AJ, AK, AL, AN	4CG	3CG
Crosley	2D	1C

IMPORTANT NOTE—Shock Absorbers on both sides of car must have same valve calibration (Right & Left Front same, Right & Left Rear same).

DELCO PARALLEL CYLINDER TYPE

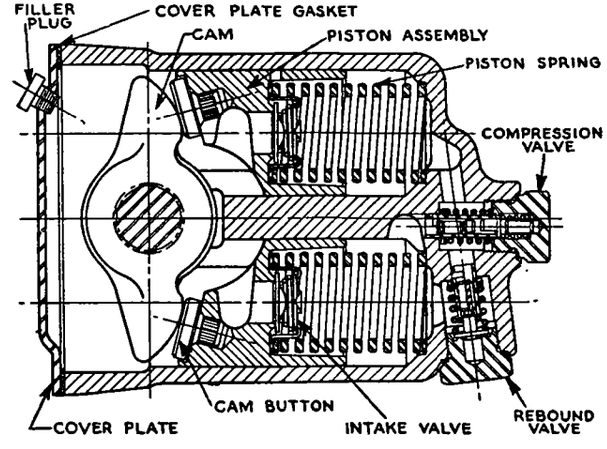
Car Model	Delco Model Number Front	Rear
Buick 40,50,60,70 (1941)	See Note	2105-C,D
Chevrolet AG, AH (1941)	2200-A,B	2100-A,B
Oldsmobile 66,68 (1941)	See Note	2105-G,H
Oldsmobile 76,78,96,98 (1941)	See Note	2105-E,F

NOTE:—Buick, Oldsmobile Front Shock Absorbers—Front shock absorbers on these models are Delco Double Acting Type (part of Front Suspension). See separate article (following) for data on this type.

SPECIAL SERVICE NOTES:—Chevrolet Valve Change to correct noise—If front shock absorbers on first cars develop 'crunching' noise, new type Compression Valve, Part No. 1069124, should be installed on both front shock absorbers. This new valve used in production on later cars.

NOTE—Valve is same calibration and marked in same manner as preceding valve but may be identified by fact that spring top coil is wound close to valve stem body.

CAUTION—New valves should be installed in both front shock absorbers at same time even though noise correction being made for one shock absorber only.



Chevrolet Valve Change to correct excessive bumping—Passenger cars operating on unusually rough roads or in Oil Field work may have excessive bumping in front end. To correct this condition heavy duty front shock absorber valves may be installed to slightly stiffen front end. Valves are as follows:

	Marking	Part Number
Compression Valve	0F	5334612
Rebound Valve	3F	1069146

NOTE—Lower control arm rubber bumpers should be checked to make certain that they are in place. Heavy duty front springs are available for correcting above condition where shock absorber valve changes above fail to correct bumping. Refer to Mechanical Equipment Index for Chevrolet Front Suspension article for spring data.

TYPE:—Double acting, parallel cylinder type with end-to-end discharge and plug type compression and rebound valves.

REFILLING:—Fluid level in shock absorber should be checked twice yearly and level maintained at bottom of filler plug hole. When adding fluid, move car up and down several times to displace all air in cylinder. When filling to correct poor performance complaints, disconnect shock absorber link and move arm through full stroke several times, then recheck fluid level. Use only Delco Shock Absorber fluid.

SERVICING:—No service operations possible other than tightening valve and filler plugs and tightening cover or replacing cover gasket to stop leaks. Pistons, springs, and intake check valve assemblies cannot be removed or serviced.

ADJUSTMENT:—Standard valve calibration for all models shown in table below. Valves can be changed for special operating conditions, if necessary, by removing valve plug and taking out valve assembly. Make certain that valve plugs are securely tightened to prevent leaks. Valve calibration is stamped on valve for identification.

Car Model	Compression & Rebound Valves Front Compr.	Reb'd.	Rear Compr.	Reb'd.
Buick 40, 50, 60, 70	2D	2	5J	
Chevrolet AG, AH	Ad-.5	1.5D	D-5	.70J
Oldsmobile (all)		.40E	2	.80M

IMPORTANT SERVICE NOTE—Shock absorbers on both sides of car must have same valve calibration (Right & Left Front same, Right & Left Rear same).

DELCO DOUBLE ACTING TYPE

Car Model	Delco Model Numbers Front	Rear

Pontiac 6 & 8 (1941)	1947-C,D	See Note
Pontiac 41-25,27 Exp. ('41)	1947-C,D	1754-R,S
Pontiac Others Exp. ('41)	1947-C,D	1754-T,U

NOTES:—Buick 40, 50, 60, 70—Front Shock Absorber interchangeable from right to left side of car (single model used). Rear Shock Absorbers on these models are Delco Parallel Cylinder type (see separate article for data).

Buick 90—Front shock absorber same as other Buick models (see note above). Rear shock absorber is double acting type for which data is given below.

Oldsmobile—Rear shock absorbers are Parallel Cylinder type. See preceding article for data on this type.

Packard—All models have Delco or Monroe Direct Acting Type (rear) shock absorbers. 'Fifth' Shock Absorber (lateral stabilizer control) is Houde (Houdaille) double acting type. See separate articles for data on these types.

Pontiac Models—Rear Shock Absorbers are Delco Direct Acting type (see separate article for data).

TYPE:—Same design as previous Delco double-acting opposed-piston types with valve arrangement and fluid flow as follows:

Types 1721, 1722, 1730, 1731, 2000, 2004—Center discharge type with outside rebound valve (rebound valve is plug type installed in tapped hole in housing). Compression valve is combined with intake valve and located in compression piston head. Valve in rebound piston head is simple intake valve.

Types 1946, 1957, 1966, 2007, 2008—End-to-end discharge type with outside compression and rebound valves (both valves are plug type and installed in tapped holes in housing). Spring-loaded intake check valve located in piston housing. Types used on front end of car are combined with Independent Suspension (shock absorbers have double arms which form upper control arms of suspension system).

Types 1947, 1948—Center discharge type with compression and rebound valves combined with intake valves in piston heads. These shock absorbers are combined with Independent Suspension systems (shock absorbers have double arms which form upper control arms of suspension system).

REFILLING:—Remove filler plug on side or top of shock absorber body, use genuine shock absorber fluid to fill reservoir to level of filler plug hole, replace plug, move car up and down several times to expel air from shock absorber cylinders, remove filler plug and add additional fluid (if required to

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

bring level up to plug hole). Install filler plug and tighten securely.

NOTE—When filling shock absorber after servicing, or if fluid level low, or if unsatisfactory performance being corected, disconnect shock absorber link and work shock absorber arm up and down to insure all air being expelled from cylinders.

SERVICING:—Disassembly. Use special fixture to clamp shock absorber on bench (do not clamp cylinder in vise). Use special wrench to remove end cap at each end of cylinder. Remove retainer ring or snap ring which locks valve assembly in piston head, remove valve assemblies. On types with compression, rebound, or control valves mounted under plugs on side of case, unscrew plugs, remove valve assemblies. When installing valve assemblies, use special tool to compress spring while snap ring installed. Make certain that snap ring installed with open end out (to facilitate snap ring removal).

Assembly—Use new gasket under end caps, apply small amount of Lubriplate or soft soap between end cap and end plate, and between end plate and gasket to prevent damage to gasket when end cap tightened, tighten end cap securely.

NOTE—Shock absorber can be filled with fluid after one end cap installed by mounting shock absorber so that open end is up and filling with fluid while arm is being worked to expel air. Always check fluid level by removing filler plug after assembly completed and with shock absorber in same position as when mounted on car.

ADJUSTMENT:—No adjustment provided other than changing control valves. Standard valve calibration for all models is shown in table below.

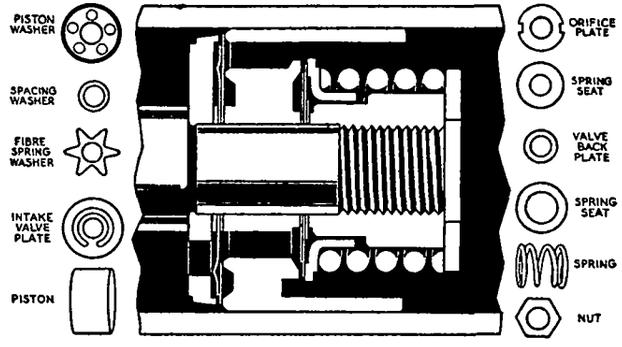
Pontiac—All Models (1941)		1024-V

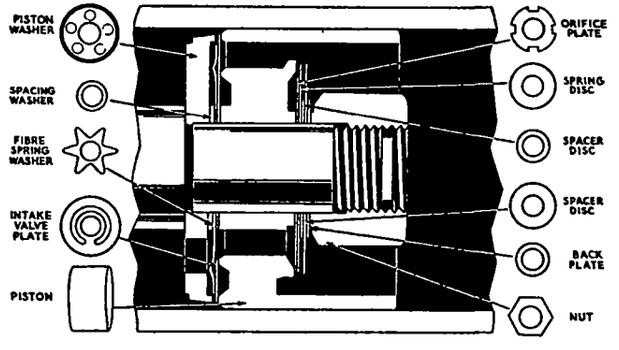
①—Cars with 18" wheels.
②—Cars with 20" wheels.
③—Except Coupes which have Monroe equipment.

NOTE:—Chrysler, DeSoto, Dodge, Plymouth Models—Delco Direct Acting Adjustable Shock Absorbers are used as Export equipment on these models. Monroe Direct Acting Shock Absorbers are used on Chrysler C28 and C30 as standard equipment. See separate articles for data on these types.



Hudson—Monroe Direct Acting Shock Absorbers are used on Coupes and on other Hudson models. See separate article for data on this type.

Packard—Front Shock Absorbers are Delco Double Acting type (part of Independent Suspension). Rear Shock Absorbers on other Packard models are Monroe Direct Acting type. See separate articles for data.



Pontiac—Front Shock Absorbers are Delco double acting type (part of front suspension assembly). See separate article for data on this type.

TYPE:—Double acting, three-tube, piston type similar to types used on preceding 1940 car models in that piston rod diameter is ½" and seal can be replaced (requires new service tools). NOTE—These models do not have filler plugs and must be disassembled for refilling (see Refilling directions following).

REFILLING:—Shock absorbers must be removed from car and disassembled as follows: Clamp lower eye in vise with shock absorber vertical (use special two-piece fixture #730 to hold bayonet end types—do not clamp bayonet end or shock absorber tube in vise). Pull shock absorber out to fully extended position, insert prongs of special wrench through holes in dust cover tube so as to engage slots in top guide (at upper end of reservoir tube—use care not to mar piston rod), unscrew guide, lift entire top assembly off, remove wrench. Remove lower end assembly (reservoir tube) from vise and pour out old fluid. Tap inlet and compression valve assembly out of lower end of pressure tube (top assembly), pull pressure tube out of dust tube and piston rod assembly so as to remove all old fluid from cylinder. Clamp top eye of shock absorber in vise with top assembly vertical and pressure tube fully extended. Measure exact correct amount of new fluid (see Fluid Capacity data below) and pour fluid into pressure tube until it is filled within ¼" of top, pour remainder of fluid into reservoir tube before it is installed. Install inlet and compression valve assembly in end of pressure tube. Clamp reservoir tube in vise, install new rod guide retainer gasket in top of reservoir tube (soak gasket in fluid and see that it seats properly in upper end of tube), install top assembly and turn in clockwise direction to engage threads on guide in reservoir tube, then extend shock absorber fully and use special wrench to tighten rod guide securely.

Types 1000, 1001, 1024

Types 1007,8,16,21,23,26

Fluid Capacity:—Fluid capacity differs for each type shock absorber and correct amount can be determined by suffix letter of model number or collapsed length as explained below.

Model Suffix Letter—Letter following model number—1000-C—indicates capacity as shown in table below. NOTE—Do not confuse this letter with valve calibration lettering which is also stamped on outer dust tube of shock absorber.

Collapsed Length—Fluid capacity may also be determined by measuring length with shock absorber fully collapsed. On 'Eye End' types, measure from center of eye on each end (on eye end types with one bayonet end, measure from center of eye to base of bayonet stem on opposite end). On 'Bayonet End' types, measure from base of bayonet stem on each end.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Fluid Capacity

DD	14 15/16	14	8⅛	239
EE	15 3/16	14¼	8¼	244
FF	15 7/16	14½	8⅜	249

SERVICING:—**Disassembly**—Remove top assembly (outer tubes, piston rod, and piston) as directed under Refilling (above). Unscrew piston rod nut (nut is staked in place), remove piston and valve parts (mark piston to insure replacement in same position on piston rod, note position of valve parts to insure correct order of replacement). Withdraw pressure tube and piston rod guide (see guide removal directions below if seal is to be replaced). Wash all parts of shock absorber in gasoline and dry with air (do not use solvents which will damage seal). All parts must be absolutely clean and dry.

Piston Rod Guide Seal Renewal—Remove guide from end of pressure tube by inserting handle of long screwdriver in tube and tapping guide out using care not to damage guide threads. Use Seal Extractor Fixture #724 (for shock absorbers with ½" piston rod) clamped in vise with round end up, place guide assembly on end of extractor and hold firmly while seal is being pried out with screwdriver. Press new seal in being careful to press only on outer edge of seal on types with leather wiper or raised center portion (use old shock absorber piston as press tool). On types without this leather wiper or raised center portion, apply pressure evenly on all sides of seal (use round stock of same diameter as seal).

Piston & Valve Assembly—When re-installing old piston, use care to line up marks on piston and rod (made before disassembly) to prevent piston binding in cylinder and install all valve parts in same order as removed. If new piston being installed, check for binding in cylinder after piston nut is tightened by moving tube up and down. If piston binds, loosen nut and try new position on rod. Piston can also be seated before piston nut is tightened by pulling cylinder out to fully extended position and then rotated 90° and forced down on piston. Nut should then be tightened and staked in position to prevent loosening in service. Recheck for binding by moving shock absorber through entire travel.

Reassembly—If piston rod removed from rod guide (for seal removal, etc.), install special #721 thimble on end of rod when installing rod through seal assembly and rod guide to prevent damage to seal. Install piston and valve assembly (above), then fill with exact correct amount of new fluid and reassemble as directed under Refilling above.

CONTROL VALVE CALIBRATION:—Standard valve calibration for each type shock absorber shown in table below. Valves consist of Compression and Inlet Valve Assemby (seated in lower end of pressure tube) and Rebound and Relief Valve (assembled on piston and held in place by piston nut).

Compression & Inlet Valve Assembly—This assembly cannot be dismantled and must be replaced as a unit.

Rebound & Relief Valve—See illustration for valve assembly which is different for the series 1000 1001, 1024 models, and for the 1007,8,16,21,23,26 models. Performance is controlled by the Orifice Plate (all models), Valve Disc and Valve Spring (1000, 1001, 1024); Spring Discs and Spacing Discs (1007,8,16,21,23,26).

Plymouth P11,P12 ('41) Exp.②	1134-E	1130-Y

①—Cars with 18" wheels. ②—With 20" wheels.

NOTE:—**Chrysler, De Soto, Dodge, Plymouth**—Delco Direct Acting Shock Absorbers (not adjustable) used as standard equipment on all models except C33 (see preceding article for data). Monroe Direct Acting Shock Absorbers also used on Chrysler models (see separate article for data).

Packard Models—Delco or Monroe Direct Acting Shock Absorbers used on domestic cars. See separate articles for data on these types.

TYPE:—1⅜" piston, double acting, three tube, piston type with adjustment for Soft and Firm control. Same as types used on 1940 car models (see Orifice Plug data below). NOTE—These large type shock absorbers with 1⅜" piston may be readily identified by larger diameter of outer dust tube (approx. 2⅝").

Orifice Plug—Consists of a calibrated metering restriction installed in the piston rod guide at the top of the pressure tube which allows fluid to escape from the cylinder directly into the reservoir tube when the shock absorber is being extended (rebound stroke). See Orifice Plug service data below.

REFILLING:—Shock absorber must be removed from car, disassembled, old fluid poured out, and filled with exact correct amount of new fluid when being reassembled. Procedure same as for non-adjustable types (see preceding article) except as follows: Shock absorber must be set in 'Soft' position before being disassembled (see Adjustment directions following) and knock-out plugs in dust tube slots must be removed before wrench can be inserted. Retainer nut is separate part and not combined with rod guide and oil seal assembly. When assembling shock absorber use new cork and rubber guide gaskets under retainer nut (install cork gasket first and rubber gasket on top). IMPORTANT—Check Adjustment before re-installing shock absorber on car.

Fluid Capacity:—Differs for each type and correct amount can be determined by model letter or collapsed length as follows:

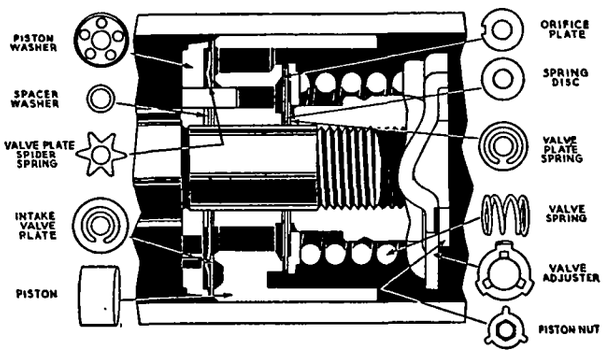
Model Suffix Letter—Letter following model number—1134-**W**—indicates capacity as shown in table below. NOTE—Do not confuse this letter with valve calibration lettering which is also stamped on outer dust tube of shock absorber following model designation.

Collapsed Length—Fluid capacity may also be determined by measuring length with shock absorber fully collapsed. On 'Eye End' types, measure to center of eye on each end (on models with one bayonet end, measure from center of eye to base of bayonet stem on opposite end). On 'Bayonet End' types, measure to base of bayonet stem on each end.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Fluid Capacity



Model Letter	Collapsed Length Eye End	Bayonet End	Capacity Ozs.	CCs.
E	9"		6¾	202
L	10⅜"		8¾	260
S		11 9/32"	10⅞	320
T	12⅛"		11⅛	330
W	12⅞"		12	359
Y	13⅜"		12⅝	379

ADJUSTMENT:—Disconnect lower end of shock absorber or remove unit from car (upper end must be held stationary while adjustment being made). Collapse unit fully and turn lower end in direction of arrow on tube (counter-clockwise) until tang on adjusting cam engages slot in lower end of pressure cylinder within unit (determine engagement by feel). Note position of notch on dust tube in relation to marks on cylinder (3 notches spaced 120° apart on cylinder for two positions—'S' Soft, 'F' Firm; if unit has been disassembled these marks may not indicate setting correctly). To change setting, rotate lower end of unit in **counter-clockwise direction only** until a stop position is felt (unit will tend to lengthen slightly in Soft position, shorten slightly in Firm position). There are six stop positions in one revolution which are alternately Soft and Firm (collapsed length changes approximately 1/16" between positions). In order to line up reference marks on housing in each position, rotate lower end 1/6 revolution to change setting from Soft to Firm or Firm to Soft (one notch will be in line with 'S' or 'F' figure at end of each 1/6 turn). IMPORTANT NOTE—Shock absorbers on both sides of car must be set alike for balanced operation.

SERVICING:—**Disassembly**—Clamp lower eye in vise with shock absorber vertical (use special fixture for bayonet end types—do not clamp bayonet end or shock absorber tube in vise), remove knock-out plugs in dust tube holes, pull shock absorber out to fully extended position, insert prongs of special wrench through dust tube holes and engage slots in retainer nut (use care not to mar piston rod), unscrew retainer nut, lift entire top assembly off. Tap compression valve assembly out of lower end of pressure tube. Use Allen wrench to unscrew nut on lower end of piston rod (nut seats in adjusting cam so that ordinary wrench cannot be used), withdraw piston and valve parts (mark piston to insure replacement in same position on piston rod, note position of valve parts to insure correct order of replacement). Wash shock absorber parts in gasoline (do not use solvents which will damage seal), dry with air. All parts must be absolutely clean and dry.

Rod Guide & Seal Assembly—Seal is integral part of guide assembly and cannot be removed (serviced as an assembly). If guide removed from pressure tube, make certain that baffle ring installed on upper end of tube under guide with open end at seal drain hole (diametrically across from Orifice Plug). See Valve Calibration data for Orifice Plug sizes.

Rebound Valve Assembly—When re-installing old piston, use care to line up marks on piston and rod (made before disassembly) to prevent piston binding in cylinder. If piston not marked, or new piston being installed, align piston in cylinder before piston rod nut is tightened by pulling tube out to fully extended position and then rotating tube 90° and forcing it down on piston. Nut should then be tightened and staked to prevent loosening in service. All valve parts should be installed in same order as removed and adjustment cam should be turned to 'Soft' position (spring not compressed).

Compression Valve Assembly—Serviced as an assembly but can be dismantled to change valve parts. To disassemble, use special tool to press in on valve washer (on lower end of intake valve stem), turn washer until hole registers with square end on stem, remove washer. Remove hairpin retainer spring in upper end of valve mounting and remove valve parts.

Reassembly—If piston rod removed from rod guide, use special thimble #583 installed on end of piston rod when inserting rod through seal and guide (will prevent threads on rod damaging seal). Install piston and valve assemblies (above), then fill with exact correct amount of new fluid and complete assembly by reversing disassembly directions above. Use new gaskets under retainer nut (install cork gasket first, rubber gasket on top). Check setting marks on shock absorber tube (if notch on dust tube not in line with 'S' mark, make new notch in line with mark and fill up old notch). Check shock absorber setting and adjust before installing on car.

CONTROL VALVE CALIBRATION:—Standard valve calibration for each type shock absorber shown in table below. Valves consist of Compression Valve (seated in lower end of pressure tube), Rebound Valve (assembled on piston), and Orifice Plug (in rod guide at top of pressure tube).

Compression Valve—Performance controlled by spring disc and valve spring (heavy inner spring).

Rebound Valve—Performance controlled by Orifice Plate, Spring Disc and Valve Spring (see illustration for valve assembly).

IMPORTANT SERVICE NOTE—Shock absorbers on both sides of car must have same valve calibration and be adjusted alike for balanced performance (Right & Left Front same, Right & Left Rear same).

HOUDE (HOUDAILLE) TYPE

Car Model	Houde Model No. Front	Rear
Ford Pass. Car Models (41)	BBCN	BBCZ
Ford Comm'l. (1941)	BBCME	BBCZ
Ford Truck (1941)	BBCME	BBG
Lincoln All Models (1941)	BBCHN	BBCLZ
Mercury Model 19A (1941)	BBCN	BBCZ
Packard 1901,1A,3,3A,4,5,6, 7,8 (1941)—See Note		NFT
Studebaker Champ.3G ('41)	BBFS2	BBDS
Studebaker Comm.11A ('41)	BBFS2	ACHS2
Studebaker Pres. 7C (1941)	BBFS2	ACHS2

PACKARD NOTE:—This Shock Absorber is the 'Fifth' shock absorber of the rear suspension system (lateral stabilizer control). Regular rear shock absorbers on these models are Delco or Monroe Direct Acting Type. See separate articles for data on these types.

TYPE:—Double acting, hydraulic type. Same design as used on corresponding 1940 car models. All models are adjustable and have the following types of Control: Adjustable Relief Valve—Ford, Lincoln, Mercury, Studebaker (All Front Shocks, Rear on Champion only), Adjustable Needle Valve (Packard), Automatic Thermostatic type with adjusting screw in shaft (Studebaker Commander & President Rear Shocks only).

ADJUSTMENT:—Ford, Lincoln, Mercury Models—Adjustment handle and pointer are provided on end of shaft. Original setting is with pointer in line with indicating mark on lever. Pointer can be turned approximately ¼ turn in either direction but must not be forced past stops on shaft. Turn pointer clockwise for firmer action, counter-clockwise for softer action. CAUTION—Do not turn pointer more than 1/32" at a time without road testing car (slight movement has considerable effect on performance). Shock absorbers on both sides of car must be adjusted alike for balanced performance.

Packard 'Fifth' Shock Absorber—Shock absorber must be removed from car, disconnected from lateral stabilizer arm and clamped vertically in vise (regular mounting position) to check timing. Hang 50 lb. weight on shock absorber arm, place arm in extreme upper position, note time required for full travel of arm from upper to lower position which should be 18 to 24 seconds. If not within this time limit, adjust as follows: Remove plug in outer end of shaft which will expose adjusting screw, turn screw in (clockwise) to increase time, out (counter-clockwise) to decrease time, recheck timing.

Studebaker Champion (all), Commander & President (Front Shock Absorbers only)—Adjustment same as for Ford models (above) by turning adjusting handle and pointer on shaft between two end-stops.

Studebaker (Others)—Automatic thermostatic type. Can be adjusted by removing cap in end of shaft which will expose adjusting screw. Original setting is with slot in adjusting screw in line with indicator mark on end of shaft. Screw can be turned approximately ¼ turn in either direction but must not be turned past '0' and 'S' marks on end of shaft which indicate end-points for adjustment. Use special tool (do not use screwdriver) and turn adjusting screw clockwise toward 'S' mark for firmer action, counter-clockwise toward '0' mark for softer action. CAUTION—Do not turn adjusting screw more than 1/32" at a time without road testing car (slight movement has considerable effect on performance). Shock absorbers on both sides of car must be adjusted alike for balanced performance.

REFILLING & SERVICING:—Same as for previous models. Shock absorbers should be inspected at 5000 mile intervals and filled to level of bottom of filler plug hole with genuine Houdaille fluid (unit must be in normal mounting position and arm should be worked up and down several times to allow all air to escape from cylinder—do not overfill).

Fluid Recommendations—Ford, Lincoln, Mercury Models—Ford Shock Absorber Fluid. Packard—Houde 800 second fluid. Studebaker (All Models) Houde No. 1400 fluid.

MONROE ADJUSTABLE DIRECT ACTING HYDRAULIC TYPE

Used On:

Willys, Americar & Plainsman 441 (1941)
Willys, Commercial Models (1941)

Front Shock Absorbers—Part No.

	Willys No.	Monroe No.
Standard Control	639022	11422
Heavy Duty	639187	11429

Rear Shock Absorbers—Part No.

Standard Control	639008	11425
Heavy Duty	639188	11430

TYPE:—Direct Acting, adjustable, piston type. Shock Absorber case is welded in assembly and cannot be dismantled for servicing or refilling.

SERVICING:—Serviced by replacement (case is welded and Shock Absorber cannot be dismantled).

ADJUSTMENT:—Shock absorbers set at factory for standard control (see table below) and performance should be satisfactory for all average riding conditions. Before changing adjustment to correct riding complaints, see that tires are properly inflated, springs and shackles lubricated and properly adjusted.

To Adjust—Remove shock absorber from car or disconnect lower mounting (necessary in order to collapse instrument fully). Collapse shock absorber fully by pressing upper and lower halves together and hold in this position until adjustment completed. Turn shock absorber cylinder to right (clockwise) slowly until adjustment key can be felt to drop into and engage slot in valve (within shock absorber). Continue to turn cylinder to right until a definite stop is felt (4 turns maximum) which indicates that valve is closed. Then turn cylinder to left (counter-clockwise), to open valve desired number of turns as shown in table below.

IMPORTANT NOTE—Shock absorbers on both sides of car must always be adjusted alike (Right & Left Front same, Right & Left Rear same).

Adjustment Table

Control	Valve Opening
Firm Control	0-1½ turns
Standard (Average)	1½-2½ turns
Soft Control	2½-4 turns

CAUTION—Use hand pressure only when making adjustments and do not force beyond fully closed and fully open where definite stop will be felt. Maximum range of adjustment is 4 full turns. Operate shock absorber only in upright position.

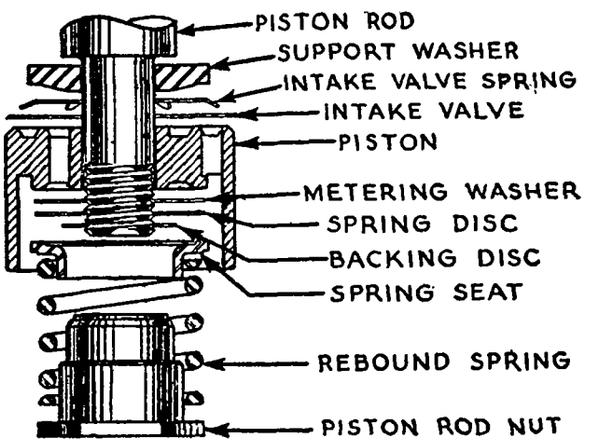
MONROE DIRECT ACTING TYPE

Car Model	Monroe Model Nos. Front	Rear
Chrysler C28,C30 (1941)		
Chrysler C28 7 Pass. ('41)		
Hudson 10,18 (1941) ①	160101	160107
Hudson 10,12,18 (1941) ②	161657	161658
Hudson 10,12,18 (1941) ③	161636	160108
Packard 1900 (1941)		364630
Packard 1903,6 Early (1941)		364725
Packard 1903,6 Late (1941)		

①—Sedan Models. ②—Coupe Models.
③—All Models equipped with Heavy Duty Springs.

PRODUCTION CHANGE NOTE:—Packard 1903,6—Shock absorber valves changed in production (see Valve Specification table below). With this valve change, Shock Absorber Assembly Number was changed from Monroe No. 11423 to 11428.

NOTE:—Chrysler Models—Delco Direct Acting Shock Absorbers used on some cars (see Delco article for data).



Hudson Models—Delco Direct Acting Shock Absorbers used on other Hudson models (see Delco article for data).

Packard Models—Delco Direct Acting Shock Absorbers used on export cars and other Parckard models. Fifth Shock Absorber (rear suspension control) is Houde Model NFT (see Delco and Houde articles for data).

TYPE:—Double acting, hydraulic, piston type with '3 tube' construction (Inner Pressure Tube and Reservoir Tube are part of lower assembly, Outer Dust Tube part of top assembly). New type rod guide and seal assembly is screwed in upper end of reservoir tube and requires special T-317 wrench for removal (wrench inserted through slots in dust tube with shock absorber fully extended). Compression valve is light press fit in lower end of pressure tube (must be removed for refilling) and is serviced as an assembly. Rebound relief valve (on piston rod) differs on various car models (see Valve Calibration data below).

REFILLING:—Refill at 25000 mile intervals for ordinary driving conditions (more frequently for hard service or if unit shows serious leakage or loss of control). To refill, disassemble unit as directed in Service section below, clean out all old fluid and wash all parts, install correct amount of new fluid when reassembling.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Fluid Capacity Chart

Car Model	Front	Rear
Chrysler C28,C33	3¾ ozs.	6⅜ ozs.
Hudson 10,12,18	3¾ ozs.	6⅜ ozs.
Packard 1900,3,6		6¾ ozs.

SERVICING:—Disassembly—Remove shock absorber from car, clamp lower eye in vise with unit vertical, (use special T-360 clamping block for Hudson), pull out to fully extended position, insert prongs of special T-317 wrench through slots in outer dust tube so as to engage holes in top of piston rod guide, turn wrench counter-clockwise to unscrew guide from reservoir tube, lift entire head assembly out. Clamp upper eye in vise so that head assembly mounted vertically, remove compression valve assembly by tapping it lightly while working assembly out of pressure tube. Remove nut on end of piston rod, remove piston and valve parts from piston rod. If piston rod seal to be replaced, remove pressure tube and piston rod guide from piston rod, tap guide out of pressure tube (guide is press fit in end of tube). Seal should not be removed from guide (serviced as an assembly). CAUTION—Do not clamp pressure tube in vise and us extreme care not to distort tube. **Servicing**—Wash all parts in clean naptha or gasoline, replace all worn or defective parts, always use new gasket under piston rod guide in reservoir tube when reassembling.

Reassembling & Refilling—Use Thimble T-347 to install piston guide on piston rod to avoid damage to seal, install all valve parts and piston in correct order (see illustration—metering washer not used on all models), tighten piston nut securely. Measure correct amount of new fluid in measuring cup, pull pressure tube and guide up on piston rod, pour fluid into tube above piston until tube is full. Install compression valve assembly on upper end of pressure tube, tapping valves securely in place in tube and using extreme care not to spill fluid out of tube. Clamp base assembly in vise vertically, pour remainder of fluid into reservoir tube. Use new gasket in top of reservoir tube, install head assembly and tighten piston rod guide securely with T-317 wrench. NOTE—See that stone shield (on lower tube) faces forward on rear shock absorbers when installed.

CONTROL VALVE CALIBRATION:—Standard Control relief valve and metering washer calibration should provide satisfactory control for normal operating conditions. Shock absorber performance can be varied for special operating conditions by changing valve calibration to 'Light Control' or 'Heavy Control' as shown in table below.

CONTROL VALVES:—Consists of Rebound Relief Valve (on piston rod under piston) and Compression Valve Assembly (in lower end of pressure tube). Compression valve cannot be dismantled and is serviced as an assembly. Several types of Rebound Relief Valves have been used as follows (see Valve Calibration data below for part numbers for each car model):

Car Model	Metering Washer	Relief Valve Disc Assembly 1st Disc	2nd Disc	Spacer	3rd Disc	4th Disc
Hudson 10,12,18 Front①	10863-2	10849-6	10849-8	10856-4	10849-10	10849-10
Hudson 10,12,18 Front②	10863-3	10849-6	10849-6	10856-4	10849-8	10849-10

①Standard Control. ②Light Control. ③Heavy Control.

Chrysler, Hudson, Packard Types—These Rebound Relief valves are built up of calibrated valve discs installed on piston rod directly below metering washer (two groups of two with spacer disc between each group—total number of valve discs differ on various models, see valve calibration chart below). Chrysler models have a spring below the valve assembly which increases the tension of the valve spring disc (see illustration).

IMPORTANT NOTE—Shock absorbers on both sides of car must have same valve calibration (Right & Left Front same, Right & Left Rear same).

MONROE SINGLE ACTING HYDRAULIC TYPE

Used On:

Bantam, Model 65 (1941)—Passenger Cars.

NOTE:—This type shock absorber used on passenger car models only. See Bantam 'M' page for data on friction type shock absorbers used on other models.

DESCRIPTION & OPERATION:—Single Acting, hydraulic type. Piston within cylinder is held out against cam on shock absorber shaft by spring within cylinder. On outward stroke (when car springs compressed by road shock), fluid flows freely into cylinder through check valve in piston head. On rebound stroke, fluid escape from cylinder is restricted by adjusting needle valve in by-pass channel and by relief valve in piston head.

ADJUSTMENT:—Adjusting needle valve should be turned in for firmer action, out for softer action. To adjust, turn valve in until it is lightly seated, then back valve off required amount to secure desired shock absorber action.

CAUTION—Valve must not be set at less than 1/6 turn open. Shock absorber will be damaged if operated with valve completely closed.

SERVICING:—Refilling. Remove top cover screw, fill case with Monroe fluid to level even with lower edge of screw hole.

Disassembly. Take out cover screws, remove cover and gasket, withdraw piston, spring and valve assembly. When reassembling, see that gasket in good condition and tighten cover screws securely to prevent leaks.

GEMMER WORM-AND-ROLLER WITH PUSH-PULL ADJUSTMENT TYPES 305, 335

Model 305

Special Types—See Note

DODGE, MODEL D19 (1941)
FORD, PASS. CARS & COMM'L. (1941)
PLYMOUTH, MODELS P11, P12 (1941)

NOTE:—Chrysler C30, C33 & C28, DeSoto, Dodge 7 Pass. Models—These steering gears are new design with 'three-tooth' roller. Adjustments are made in same manner as on other models.

Dodge & Plymouth Models—These steering gears built by Chrysler but are similar in design to Gemmer 305 (except 7 Pass.), 335 (7 Pass.), and are adjusted in same manner.

Ford Models—These steering gears built by Ford but are similar in design to Gemmer Model 305 and adjusted in same manner.

ADJUSTMENT:—Before making adjustments, jack up front wheels and disconnect drag link to free steering gear (front wheels should turn freely with not more than 10 lbs. pull on drag link in either direction). Align steering column by loosening frame bracket bolts to allow gear to shift in frame, tighten bolts, then loosen instrument board bracket bolts to allow bracket to shift in alignment with column, tighten bracket bolts. Make adjustments in order as follows:

Worm Shaft Bearing Adjustment—Loosen lower cover screws, separate and remove top shim (use care not to damage remaining shims), tighten cover screws and check adjustment. Steering wheel should turn freely without stiffness with drag link disconnected (if stiffness still evident after steering column alignment checked, worm bearings are too tight). On Chrysler, DeSoto, Dodge, Plymouth models wheel should turn with ⅜-¾ lb. pull on rim with cross-shaft out of housing (worm bearing drag only).

Roller Mesh in Worm—To check, turn steering wheel so that roller on 'high' mid-point of worm (count number of turns from one end position to the other, then turn wheel back ½ this number of turns, or place steering wheel in straight ahead position as directed below), shake steering arm to determine play or lost-motion at ball end (with drag link disconnected). If lost-motion exceeds 1/32", adjust as follows: Remove roller shaft adjustment screw locknut on steering gear side cover (accessible through hole in frame rail on Hudson models), slide lock plate off far enough to clear lock boss on cover, tighten adjusting screw just enough to eliminate steering arm lost-motion but without causing roller to bind on worm (slight play preferable to any binding), slide lock plate into position so that it engages boss on cover, install and tighten locknut. Check to see that steering wheel turns freely through entire range without binding. On Chrysler, DeSoto, Dodge, Plymouth models, wheel should turn through this center 'high' point with 1-2¼ lbs. pull on wheel rim (this includes ⅜-¾ lb. worm bearing drag). On Hudson models, pull should be 2 lbs.

NOTE—No separate adjustment required for roller shaft endplay (shaft controlled in both directions by above push-pull adjusting screw).

Steering Wheel Position (Hudson):—Notch in end of shaft should point straight down (visible with horn button and contact plate removed) and steering wheel spokes should be horizontal with roller on 'high' mid-point of worm. If wheel position not correct, adjust by shifting shims from one ball seat to the other in the steering arm end of the drag-link.

Nash Models—Steering wheel marked on underside of hub and mark should point straight down with roller on 'high' mid-point of worm.

Steering Linkage (Chrysler, DeSoto, Dodge, Plymouth models):—Steering gear arm connected directly to each wheel by long (right hand), short (left hand) tie rod. Toe-in adjustments should be made by shortening or lengthening both tie rods equally. If steering gear roller not on 'high' mid-point of worm with wheels in straight ahead position (after toe-in adjustment completed), correct steering gear position by lengthening one tie rod and shortening other rod exactly equal amount (to avoid disturbing toe-in adjustment).

CAUTION—When tightening clamp bolts, make certain that both ends of tie rod against same side of ball end studs (so that rod can rotate slightly on ball ends) and that clamp bolt on left end of long tie rod is below tie rod (to prevent interference on turns).

Hudson—Center-point steering type linkage with intermediate steering arm on center of front crossmember and individual tie rods between this arm and each wheel. Toe-in adjustments should be made by lengthening or shortening both tie rods equally so that tie rod lengths equal and intermediate steering arm centered with wheels in straight ahead position. If steering wheel position not correct, adjust as directed above.

Nash Models—Consists of center connecting rod linked between steering gear arm and idler arm on right frame side rail with individual tie rods from this connecting rod to each wheel. Toe-in adjustments should be made by lengthening or shortening both tie rods equally. If steering gear roller not on 'high' mid-point of worm with wheel straight ahead, correct by lengthening one tie rod and shortening other tie rod equally (to avoid disturbing toe-in adjustment).

CAUTION—When tightening clamp bolts, see that outer tie rod ends are horizontal and that ball stud is square in seat.

GEMMER WORM-AND-ROLLER TYPES 250, 330, 370

Model 250—See Note

NASH '600', MODEL 4140 (1941)

Model 370

FORD, BUS MODELS (1941)

Special Types—See Note

LINCOLN, ZEPHYR & CONTINENTAL 16H (1941)
LINCOLN, CUSTOM MODEL 168H (1941)
PACKARD CLIPPER, MODEL 1951 (1941)
PACKARD SIX, '110' MODEL 1900 (1941)
PACKARD EIGHT, '120' MODELS 1901,1A (1941)
PACKARD SUPER 8, '160' 1903,3A,4,5 (1941)
PACKARD CUST. SUPER 8, '180' 1906,7,8 (1941)

NOTE:—Model 250 (Nash)—This is a new model which is similar to Model 300 except for size and fact that worm is mounted on ball bearings (each bearing takes thrust in one direction). This model adjusted and serviced in same manner as other models.

Lincoln Model 330—Steering gear has a straddle mounted roller shaft with additional shaft bushing mounted in side cover on housing. Adjusted in same manner as other models.

Packard Models—These steering gears built by Packard but similar in design to Gemmer Model 330 and adjusted in same manner.

TYPE:—Worm-and-roller types similar to Gemmer designs used on previous models. See Note above on Model 250 (Nash) type which is a new design.

ADJUSTMENT:—Before making adjustments jack up front wheels and disconnect drag link to free steering gear (front wheels should turn freely with not more than 10 lbs. pull on drag link in either direction. Align steering column by loosening frame bracket bolts to allow gear to shift in frame, then loosen instrument board bracket bolts to allow bracket to shift, tighten bracket bolts. Make adjustments in order as follows:

Worm Shaft Bearing Adjustment—Loosen lower cover screws, separate and remove top shim (use care not to damage remaining shims), tighten cover screws and check adjustment. Steering wheel should turn freely without stiffness (if stiffness still evident after steering column alignment checked, worm bearings are too tight). On Packard models, wheel should turn with 1½ lbs. minimum, 2¼ lbs. maximum pressure at rim except at center 'high' point of worm.

Roller Shaft Endplay—To check, turn wheel to end position and back ⅛ turn. Check endplay at hub of pitman arm (with drag link disconnected). To adjust, loosen locknut and turn adjusting screw on side cover just enough to take up all endplay, tighten locknut. Check to see that steering gear turns through entire range freely but without evident endplay.

Roller Mesh in Worm—To check, place steering wheel in mid-position with roller on 'high' point of worm (count number of turns from one end position to the other, then turn wheel back ½ this number of turns), check play or lost motion at end of pitman arm. If this exceeds 1/32", roller mesh in worm should be adjusted. To adjust, dismantle steering gear and remove roller shaft from housing, remove shim from shoulder on shaft and housing

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

so that play at end of pitman arm will be not more than .006" when reassembled and steering gear will turn freely without drag. On Packard, pull of 3-4½ lbs. on rim of wheel should be required to turn wheel through center position. CAUTION—Make certain that thick thrust washer (between adjusting shims and shoulder on roller shaft) installed with bevel face toward roller (away from splined end of shaft. Use special thimble (Packard ST-5032) or wrap splined end of roller shaft with tape when installing roller shaft in housing to avoid damage to oil seal.

Steering Wheel Position (Packard):—Steering wheel height not adjustable but can be raised or lowered by installing instrument panel bracket from other models as follows: **Six**—Wheel cannot be lowered but can be raised approximately 5/8" by installing 1901 steering column bracket. **Eight & Super Eight** Wheel cannot be raised but can be lowered 5/8" by installing 1900 steering column bracket. NOTE—Seat can be lowered approximately ½" by removing two wooden strips under seat frame, or raised approximately 5/8" by installing special No. 337373 tapered wedges.

Steering Linkage (Nash):—Cross type linkage used with steering gear pitman arm connected directly to right hand tie rod (steering arms extend toward front of car). Left hand tie rod is connected to the right hand rod at a point near the steering gear. With front wheels in straight-ahead position and steering roller on 'high' point of worm, wide serration on steering tube should point downward and steering wheel should be installed with line on lower face of hub in line with this wide serration. **Packard Models**—Intermediate steering arm used with individual tie rod for each wheel. If steering gear roller not on 'high' midpoint of worm and intermediate steering arm not centered with wheels straight ahead, check tie rod lengths (must be equal within 1/8") and correct by lengthening one rod and shortening other exactly equal amount (to avoid disturbing tie rod adjustment). Intermediate steering arm bearing is pre-loaded by spring washer on top (nut end) of arm shaft. Bearing not adjustable and nut should be tightened until it bottoms on bearing shoulder.

ROSS CAM & LEVER AND CAM & TWIN LEVER TYPES

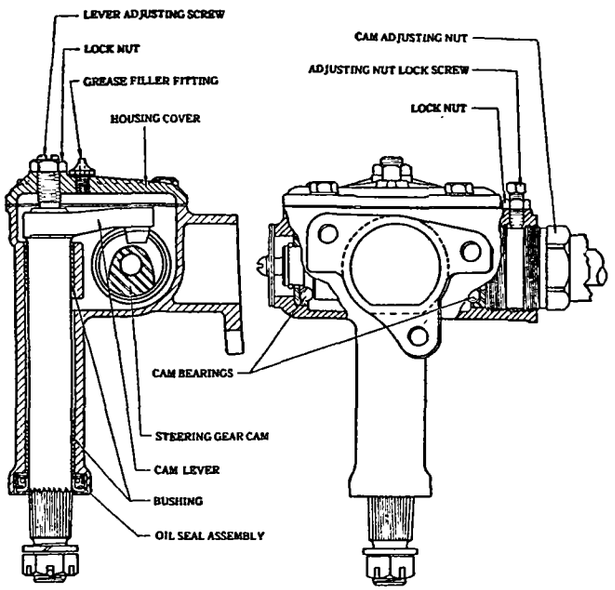
CAM-AND-LEVER TYPE
Model S-12

BANTAM, SUPER FOUR SERIES 65 (1941)
CROSLEY, MODEL CB41 (1941)

CAM-AND-TWIN LEVER TYPES
Model T-12

STUDEBAKER CHAMPION, MODEL 3G (1941)
WILLYS AMERICAR & PLAINSMAN, 441 (1941)
WILLYS COMM'L., 441 & 441P (1941)

Model T-14



GRAHAM HOLLYWOOD, 109 & 113 (1941)
STUDEBAKER COMMANDER, MODEL 11A (1941)
STUDEBAKER PRESIDENT, MODEL 7C (1941)

NOTE:—Willys Commercial Models—If Gemmer Steering Gears found on these models, these steering Gears are Model 120 and adjusted in same manner as on previous Willys models. Refer to Gemmer Model 120 Steering Gear article in manual.

DESCRIPTION:—Same design as previous S-12, T-12 & T-14 models.

ADJUSTMENT:—Before making adjustments, free steering gear from load by jacking up front wheels or disconnecting drag link (see Studebaker Steering Linkage data below). Check steering gear alignment. If stiffness evident with instrument panel bracket clamp tight, align steering gear as follows: Loosen steering gear frame bracket bolts to allow gear to shift on frame, retighten frame bolts. Loosen instrument panel bracket bolts to allow bracket to shift into alignment with steering column, tighten bracket bolts (if bracket position not adjustable, shim or otherwise change bracket position so that column not sprung when bracket bolts tightened).

Cam Endplay Adjustment—Check up-and-down movement of steering wheel and shaft in steering column jacket. If adjustment required, first loosen locknut and back off adjusting screw on housing side cover to relieve bearings of side thrust. Then remove four retaining screws in top cover on upper end of steering gear housing, move cover up on

column jacket as far as possible (about ¼"), clip and remove a thin shim in shim pack under cover (shims are installed between paper gaskets and are .003", .010", .030" or .002", .003", .010" thick), using extreme care not to damage remaining shims and paper gaskets. Re-install cover, tighten cover screws, check adjustment. Wheel should turn with barely perceptible drag (thumb and forefinger grip on wheel rim) and should have no up-and-down movement. Then adjust Cam and Lever Backlash.

Cam and Lever Backlash—Check end-play or lost-motion of lever shaft at pitman arm with steering gear turned to center position with lever studs on high points of cam. If play evident, adjust by loosening locknut on steering gear housing side cover and turning adjusting screw in until play just taken up and steering wheel turns freely throughout entire range with barely perceptible drag at center position, hold adjusting screw and tighten locknut. CAUTION—This adjustment should be made only with lever studs on high points of cam (straight ahead position). If adjusted in any other position, gear will bind at this center point.

Steering Wheel Position (Studebaker):—Center spoke (3 spoke types) should point straight down, or spokes should be horizontal (2 spoke type) with steering gear in straight-ahead position and lever studs on high points of cam. To check, count number of turns of the wheel from one extreme end position to the other, then turn wheel back exactly one-half this number of turns. If steering wheel spoke position not correct, remove wheel and re-install on shaft in correct position. See Linkage data below for pitman arm installation and location.

Other Models—Before connecting drag link, turn steering wheel to center position with lever stud on high point of cam (count number of turns of wheel from one end position to the other, then turn back ½ this number of turns), place front wheels in straight ahead position, then connect drag link without disturbing position of steering gear or front wheels.

Steering Linkage (Studebaker):—Steering gear pitman arm is special insulated type (see data below) and tie rod for left wheel is connected directly to this arm. A connecting rod is linked between the steering arm and an idler lever on the right frame side rail with tie rod for right hand wheel connected to this idler lever. This design similar to type used on 1940 cars. See that punchmarks on end of steering gear lever shaft and steering arm adapter (short arm on shaft to which insulated steering arm is bolted) are in line and adjacent to each other. Set steering wheel in center position with lever studs on high points of cam (see Steering Wheel Position above), loosen clamp bolts on **left hand tie rod** (between steering arm and left wheel), turn this left hand rod until left front wheel is straight ahead (wheel should be parallel to rear wheel but 3/8" in on Champion, 1 1/32" in on Commander, 1 3/32" in on Pres. due to wider rear tread —Comm. & Pres. new for '41), tighten clampbolt. Then make toe-in adjustment by turning **right hand tie rod only** without disturbing position of left hand tie rod after it has been correctly set for straight ahead position.

Insulated Steering Arm—On Champion, insulated steering arm can be removed by taking off nuts on two studs (on which neoprene insulators are mounted) without disturbing position of adapter on steering gear lever shaft. If adapter being removed, use puller J-871 and make certain that punchmarks on shaft and adapter lined up when adapter replaced. On Commander & President, pull insulated steering arm and adapter as an assembly using puller J-871 after removing cotter pin, nut and washer from lever shaft and disconnecting left tie rod and connecting rod from steering arm. Assembly can then be dismantled by taking off nuts on two mounting studs. When reassembling, tighten nuts on studs until washers seat against shoulders on studs. See that punchmarks on adapter and end of steering gear lever shaft line up when assembly installed.

Connecting Rod Idler Arm—Spring washer used on upper end of idler lever stud on Commander and President models to prevent idler lever rattles. This spring washer not used on Champion and idler lever stud nut should be tightened just enough to eliminate all up-and-down play of lever without causing lever to bind in bracket.

SAGINAW BALL-BEARING WORM-AND-NUT TYPE

Used On:

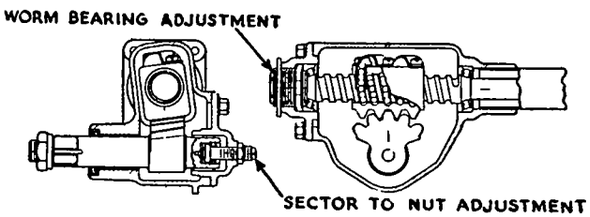
BUICK, SERIES 41-40,40A,50,60,70,90 (1941)
CADILLAC, SERIES 41-60S,61,62,63,67,75 (1941)
CHEVROLET, ALL TRUCK MODELS (1941)

DESCRIPTION:—New design Worm-and-Nut type steering gear with circulating ball contact. Balls are assembled in groove between worm and nut in two groups with return channels assembled on back of nut so that balls are free to move through circuit as nut moves up and down on worm (each circuit has 33 balls of which 23 or a total of 46 in both circuits carry the load). Gear teeth on nut mesh with sector teeth on cross-shaft so that cross-shaft (and steering gear pitman arm) rotate as the steering wheel is turned and the nut moves up and down on the steering shaft worm.

ADJUSTMENT:—Steering Gear Alignment—Check by loosening frame bracket mounting bolts (Buick), steering column bracket at instrument panel (Cadillac, Chevrolet) and noting clearance between steering gear and frame or bracket. If clearance exists at these points (indicating that column will be sprung when bolts tightened), install shims between steering gear and frame (Buick), loosen frame mounting bolts to allow steering gear to shift on frame to align with steering column bracket, or shim bracket (Cadillac, Chevrolet). Then adjust as follows:

Worm Shaft Endplay—Disconnect the drag link at pitman arm, loosen steering column bracket, loosen locknut and back off pitman shaft adjusting nut a few turns (this adjusting nut on side cover on lower side of housing). Turn steering wheel to within 1 turn of extreme end of travel (CAUTION—do not turn steering wheel hard against stops which will damage ball return mechanism). Loosen locknut and turn worm bearing adjusting screw (on bottom endplate of housing) until pull at wheel rim required to turn wheel (use spring scale such as Chevrolet J-544) is ⅞-1⅛ lbs. (Buick), ¾-1 lb. or 1-1¼ lbs. on cars driven less than 1000 miles (Cadillac), 1-1½ lbs. (Chevrolet), hold adjusting screw and tighten locknut. Tighten steering column bracket bolts and recheck bearing adjustment. If increase in pull noted (indicating that steering column sprung), check steering gear alignment as directed above. NOTE—When making this adjustment on Buick, use special wrenches as follows: J-1592 Locknut Wrench, J-1593 Adjuster Wrench.

Pitman Shaft End-play (Nut and Sector Mesh)—Turn steering wheel to center position with nut on high point of gear. Tighten pitman shaft adjusting nut on lower side cover until pull at wheel rim required to turn wheel through center high point as measured on spring scale attached to wheel rim is 2-2¼ lbs. (Buick), 1½-2 lbs. or 2-2½ lbs. on cars driven less than 1000 miles (Cadillac), 2-2½ lbs. (Chevrolet), hold adjusting nut and tighten locknut.



NOTE—This is push-pull type adjustment and controls pitman arm shaft endplay as well as gear mesh (see Lash Adjuster data in Servicing section below).

Steering Wheel Position:—Steering wheel position and height (some models only) are adjustable and should be checked as follows:

Buick (Steering Wheel Position)—Steering wheel spoke with small indentation on underside near hub should point straight down with roller on high point of worm and wheels in straight ahead position. If wheel position incorrect, see that notch on steering tube (visible with horn ring and cover removed) is toward indented spoke. CAUTION—Directional signal switch must be in 'off' position whenever steering wheel removed or replaced.

Buick (Steering Wheel Height)—All cars built with steering column set in highest position. Wheels can be lowered up to 11/16" by installation of two No. 1321253 spacers installed between steering column bracket and lower edge of instrument bracket. When installing shims, loosen steering gear frame mounting bolts (to allow steering gear to shift to new position), use new longer bolts (see note below) to attach bracket to instrument panel, tighten frame mounting bolts after bracket installed and check alignment. NOTE—New bolts required as follows: No. 1321260—4 15/16" (40,50 Left Side), 1321063—4 7/16" (40,50 Right Side, 60,70,90 Left Side), 173030—3 ¾" (60,70,90 Right Side).

Cadillac—Steering wheels should be installed so that middle spoke is vertical and directly opposite notch in end of steering column shaft (Std. 3 spoke type), or both spokes exactly horizontal (Special 2 spoke type) with nut on high center point of worm and front wheels in straight ahead position.

Steering Linkage (Buick):—Design same as 1940 type (long right hand tie rod between steering arm and right wheel, short left hand tie rod between the other tie rod and the left wheel). Adjuster at wheel end of each tie rod should be turned equally when making toe-in adjustments. If steering gear nut not on center high point of worm with front wheels in straight ahead position, adjust by lengthening one tie rod and shortening other tie rod exactly equal amounts (so that toe-in adjustment not disturbed).

Cadillac—Steering linkage design same as 1940 (connecting rod between steering gear arm and idler lever on right side of frame, individual tie rods from connecting rod to each wheel). Tie rods should be adjusted equally when setting toe-in. If steering wheel position not correct and steering gear roller not on high mid-point of worm with wheels in straight ahead position, correct by shortening one tie rod and lengthening other tie rod equally. Recheck toe-in. Idler lever is threaded in bushing and idler arm support should be tightened ¼-1¼ turns after it seats firmly against rubber dust seal.

Chevrolet—These models do not have independent suspension and steering linkage is conventional (drag link between steering gear pitman arm and left front wheel, tie rod between front wheels).

SERVICING:—Disassembly—Remove steering wheel, disconnect drag link at pitman arm, remove steering gear and column assembly from car. Remove steering column upper bearing. Loosen locknuts and back off both adjusting screws (on lower side and bottom cover plates). Remove screws on side cover and remove the cover assembly from housing so that pitman arm shaft and sector gear will be disengaged from nut. Take out bottom cover screws, remove cover, lower worm bearing, cup and thrust washer. Pull steering worm and nut assembly out through lower end of housing. CAUTION—Hold shaft in horizontal position and use extreme care that nut is not allowed to run down on worm against stops which will damage ball return mechanism (nut will move of own weight if shaft tilted or vertical). Manufacturer recommends that worm nut and balls not be disassembled.

Lash Adjuster (Sector shaft endplay)—With lash adjuster screw and shim installed in slot in end of sector cross-shaft, check clearance or endplay with feeler inserted between head of screw and bottom of slot in cross-shaft. Clearance should not exceed .002" and is adjusted by installing lash adjuster shim of correct thickness (Chevrolet Adjuster Shim Unit No. 605142 contains shims .063", .065", .067", .069" thick).

Ball Nut Assembly—To disassemble ball nut (required only if nut binds or is tight on worm), remove screws and ball guide clamp, withdraw guides (use clean pan to catch balls), hold nut upside down and rotate wormshaft back and forth until all balls drop out into pan (use extreme care to save all 66 balls—these are special type and no other types of balls should be used in steering gear under any circumstances), remove nut from worm (nut can be pulled off end of worm after all balls removed). Wash all parts in clean gasoline, dry with clean cloth and examine for signs of wear or damage. To reassemble ball nut, divide balls into two equal groups of 33 each (each group installed separately in one ball circuit). Install nut on wormshaft so that grooves in nut and worm lined up with ball guide holes up and shaft horizontal. Drop balls into one guide hole and turn wormshaft gradually away from this hole until approximately 23 balls have been installed and circuit is filled to bottom of other guide hole on this circuit (if worm reaches end of travel before circuit completely filled, hold balls down with blunt end of clean punch and work wormshaft back and forth until circuit solidly filled with balls). Lay one half of ball guide on bench and install remaining balls (approximately 10) in guide using heavy grease to retain balls, assemble other half of guide, install assembly on nut so that ends of guide enter guide holes of the ball circuit which has been previously filled with balls, tap guide down into place lightly. Fill second ball circuit and install second ball guide assembly in same manner, install guide clamp and tighten clamp screws securely.

CAUTION—Use extreme care to install exactly 33 balls in each ball circuit (count balls as they are installed). Steering gear will not operate correctly if wrong type balls or incorrect number use.

Reassembly—Replacement shaft and nut assemblies are taped to prevent nut moving on worm. When removing tape, hold shaft horizontally and use extreme care that nut does not run down on worm against stops which will damage ball return

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

mechanism. Install shaft and nut assembly in steering gear housing, replace worm bearing, cup, thrust washer, gasket, bottom cover plate, insert and tighten cover screws. Install upper bearing spring seat and spring, bearing washer, cotter pin, steering wheel. Adjust worm bearings (see Adjustment above). Rotate steering wheel until nut in center of travel so that center tooth of pitman arm shaft sector gear will engage center tooth space on nut, push shaft and side cover into place, tighten cover screws. Fill housing with steering gear lubricant, re-install steering gear in car.

SAGINAW WORM-AND-ROLLER TYPES

Used On:

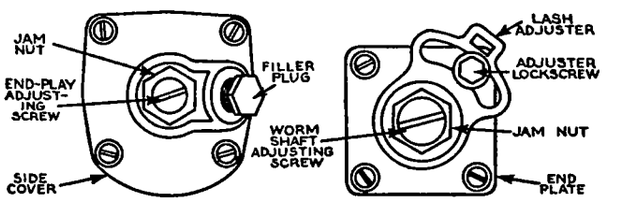
OLDSMOBILE 6, 66, 76, 96 (1941)
OLDSMOBILE 8, 68, 78, 98 (1941)
PONTIAC SIX, 41-24, 41-25, 41-26 (1941)
PONTIAC EIGHT, 41-27, 41-28, 41-29 (1941)

SPECIAL SERVICE NOTES:—Pontiac. To correct road noise telegraphed up the steering column on standard steering wheels being amplified by steering wheel center ornament, a new insulated type steering wheel cap, Part No. 506745 can be installed to correct this condition. This new type steering wheel cap was used in production starting with the following car serial numbers:

Model	Pontiac	Linden
Deluxe Torpedo 6	P6JA 55089	L6JA 19092
Streamliner Torpedo 6	P6JB 41866	L6JB 11079
Deluxe Torpedo 8	P8JA 19375	L8JA 6468
Streamliner Torpedo 8	P8JB 33070	L8JB 7630

South Gate Note—Starting car serial numbers when this new insulated steering wheel cap was installed on cars built at South Gate, California, are not available.

TYPE:—Worm and double-tooth roller design. Same as used on corresponding 1940 car models.



ADJUSTMENTS:—Jack up front wheels, turn steering wheel to straight ahead position, disconnect steering relay rod or drag link from pitman arm (noting ball seat and spring assembly so that parts can be reassembled in same order), see that reference mark on pitman arm and roller shaft are lined up, tighten pitman arm nut with 18" wrench, check column alignment by noting pull at steering wheel rim required to turn wheel through center position (if pull exceeds 1¾-2¼ lbs. on Oldsmobile, 1¼-1¾ lbs. on Pontiac, align steering column as directed below).

Steering Column Alignment—Loosen steering column dash mounting bracket bolts. If this relieves binding, shim bracket out so that column will not be sprung when bolts are tightened.

Roller Shaft Endplay—If endplay perceptible with steering wheel turned to within ⅛ turn of either end position, adjust as follows: Tighten retaining screws on steering gear housing side cover (faces up on some models), loosen adjusting screw locknut, turn adjusting screw in until endplay is just taken up, hold screw and tighten locknut. Check to make certain that wheel revolves freely without binding.

Worm Shaft Endplay—Turn steering wheel to within ⅛ turn of either end position, loosen locknut on adjusting screw at center of lower cover, turn adjusting screw in until steering wheel turns with pull of 1-1½ lbs. (Oldsmobile), ⅜-⅝ lb. (Pontiac) measured at steering wheel rim with wheel turned near the end position. Hold adjusting screw and tighten locknut, recheck pull with locknut tightened. CAUTION—Do not back adjusting screw out which will allow bearings to get out of alignment.

Worm and Roller Backlash—Turn steering wheel to center position with roller on 'high' mid-point of worm (see Steering Gear Position adjustment be low), tighten lower cover screws, loosen lash adjuster lockscrew on lower cover (hexagonal headed capscrew in lash adjuster slot), tap lash adjuster in direction of arrow cut in adjuster above lockscrew not more than 1/16" at a time until pull required to turn steering wheel through center 'high' position is 1¾-2¼ lbs. (Oldsmobile), 1¼-1¾ lbs. (Pontiac), tighten lash adjuster lockscrew. Check to see that wheel turns freely throughout range without binding. CAUTION—Lash adjuster must not be tightened beyond maximum figure given above, and lash adjuster should be tightened only when making this adjustment (do not back adjuster off).

Steering Wheel Position:—Check steering wheels and adjust for correct spoke location in straight-ahead position as follows:

Oldsmobile—On three-spoke wheels, spoke next to horn button connector opening should point straight down with roller on high point of cam and wheels in straight ahead position (mark on hub should be adjacent to and in line with mark on shaft). Adjust by removing wheel and changing position on shaft. Make certain that steering wheel nut staked to prevent loosening when wheel re-installed.

Pontiac (2 Spoke Std. Type)—Spokes should be horizontally even and steering wheel emblem should be horizontal with steering gear and front wheels in the straight ahead position. HORN BUTTON NOISE CORRECTION — See Special Service Notes (in first column) for insulated type steering wheel cap to correct noise on early car models.

Pontiac (3 spoke Deluxe Type)—Lower center spoke of wheel should point straight down (within 5°) and steering wheel emblem should be horizontal with steering gear and front wheels in straight ahead position.

Steering Linkage (Oldsmobile & Pontiac):—Linkage is same design as used on 1940 cars with connecting rod between steering gear pitman arm and idler lever on right hand frame side rail and individual tie rods between connecting rod and each wheel. Idler lever bushing is threaded in arm and on support and arm must be assembled as follows:

Idler Arm Bushing Installation—With arm support removed from frame, screw bushing into idler arm and tighten securely, install seal on support and screw support into bushing until distance from shoulder on support to top face of idler arm is 23/32" plus or minus 1/32". Install assembly on car.

SAGINAW (CHEVROLET PASS. CARS) WORM-AND-ROLLER TYPE

Used On:

CHEVROLET, MASTER DELUXE AG, SPECIAL DELUXE AH, PASS. CARS & SEDAN DELIV. ('41)

TYPE:—Worm-and-roller design with roller mounted on double-row ball bearing. Same design as used on corresponding 1940 models.

ADJUSTMENT:—Make all adjustments in order as follows:

Worm Shaft Endplay. Remove pitman arm, loosen jacket clamp bolt (on lower end of column directly above steering gear housing), loosen adjusting nut clamp bolt in upper end of housing, see that some backlash exists between worm and roller (if necessary, loosen locknut and back off roller shaft adjusting screw on housing). Use 1 9/16" wrench and turn adjusting nut in upper end of housing in until pull of ½ lb. at rim of steering wheel required to turn wheel. Tighten adjusting nut clamp bolt and jacket clamp bolt.

Roller Shaft Endplay—Loosen locknut and turn adjusting screw (on top of housing) in until tight then back screw off until it is free, finally turn screw in until it just contacts end of roller shaft, hold screw and tighten locknut.

Worm and Roller Backlash—Turn steering wheel to center position with roller on high point of worm (count number of turn from one end position to the other, then turn wheel back ½ this number of turns). Check roller shaft backlash or play by shaking pitman arm. To adjust, loosen three steering gear cover bolts ¼ turn, loosen eccentric bolt locknut ½ turn. With one wrench on eccentric bolt and second wrench on eccentric bolt sleeve, turn bolt and sleeve slowly in opposite directions until pitman arm play has been taken up (CAUTION—Use extreme care not to turn eccentric bolt and sleeve more than necessary to take up play, any excess will damage steering gear, normal adjustment is approximately ⅛ turn). Hold eccentric bolt from turning and tighten eccentric bolt locknut, tighten housing cover bolts. Check steering gear to make certain that it turns freely. Pull of 1⅜ lbs. max. at wheel rim should be required to turn wheel through center high point.

Steering Linkage (All Models):—Individual tie rods used and are connected between special rubber-bushed link on steering gear pitman arm and each wheel. Long right hand tie rod is non-adjustable and toe-in adjustments should be made by turning short left-hand rod to insure steering gear roller being on high point of worm with wheels in straight ahead position.

NOTE—Make certain that both tie rod ends are square on ball studs when tightening clamp bolts.

Horn Ring Adjustment (Special Deluxe):—Horn ring tension is adjustable by turning steering wheel lower hub housing. To adjust, loosen lockscrew, turn hub under steering wheel until desired horn ring contact secured, then tighten lockscrew. To adjust tension (pressure required to sound horn), remove ornamental cap in center of wheel, turn two adjusting screws (in recess in wheel) clockwise to increase tension, counter-clockwise to decrease tension.

BUICK TYPE

Used On:

SERIES 41-40,40A,50,60,70,90 (1941)

TYPE—Remote control type with steering column mounted gearshift lever. Design changed from that used on 1940 models as follows:

Gearshift Lever—Lever pivot or bearing formed in housing by fabricated bushing installed in inserted bearing seat and held in place by control housing cap or nut.

Control Shaft—Consists of a tube concentric with steering gear shaft with lower lever welded in place on lower end of tube and control lever housing keyed and clamped on upper end of tube. Tube is mounted on bearing in steering gear housing at lower end and on metal and fabric bearing in direction switch housing at upper end. Lever at lower end of tube is linked to idler lever (pivoted on steering gear housing) by non-adjustable rod with adjustable rod between the idler lever and the shift lever on the transmission case.

Selector Rod—Consists of a square rod within the steering column jacket which is pinned to the selector control lever pivoted on the steering column jacket at the lower end of the rod. This selector control lever is linked to selector lever on transmission case by a rod which has an adjustable trunnion at the steering column end.

Steering Gear Jacket—Two piece type with flanged slot at point where control shaft lower lever emerges. Upper section has mounting bracket for selector control lever and thrust washer assembly consisting of upper fabric and lower plain steel washer for control shaft end thrust installed in lower end. Lower section has bearing for lower end of control rod and shedder to protect bearing from dirt installed in upper end.

ADJUSTMENT:—Adjust selector control rod and shift rod separately as follows:

Selector Rod—Shift transmission to neutral. Disconnect selector rod at selector control lever on steering column, move rod to rear as far as possible, adjust trunnion position on forward end of rod so that trunnion pin engages bushing in selector control lever without disturbing position of lever or gearshift lever, connect rod.

Control Shaft Shift Rod — Shift transmission gears to second speed position. Loosen locknut (at steering column) so that control lever clears edge of slot in steering column mast jacket by ⅛", tighten locknut and connect rod. Shift gears to high speed position and check clearance. Clearance must be maintained at both upper and lower edges of slot in steering column mast jacket.

SERVICING:—Steering Column Unit—Control shaft upper bearing consists of a metal and fabric bearing pressed on upper end of control shaft lever housing in directional switch housing with a flat fabric upper thrust washer, plain steel washer, and spring washer assembled above bearing in that order. Control lever housing is key-slotted in two places and is clamped on upper end of control shaft tube by a clampscrew. Thrust in the opposite direction is taken by a fabric lower thrust washer and a plain steel washer installed between lower end of control lever housing and a plate welded in place in the steering column mast jacket. Control shaft lower bearing consists of a bushing pressed in the upper end of the steering column lower mast jacket with a flanged shedder pressed in the housing above the bearing (shedder fits within cup formed on lower end of control shaft lower lever so that dirt and water excluded from bearing). To service upper and lower bearings, use tool J-1583 to remove bearings, tool J-1585 (upper), J-1587 (lower) to install new bearings. See that thrust washers properly installed when replacing bearings.

CAUTION—When installing control shaft, use great care not to score bearings which will cause hard shifting (bearings are fabric which is soft). Always install new bearings when old bearings removed.

Gearshift Lever—Lever bearing is fabricated bushing which is formed when lever housing nut is tightened. When installing lever, make certain that plunger spring and plunger are in place at upper end of selector rod and that anti-rattle grommet is installed on inner end of gearshift lever. Install bearing seat on lever, then install lever in control lever housing, making certain that inner end engages selector rod properly. Install bearing on lever ball with small outside diameter toward outer end of housing, tighten housing nut securely so that shoulder in nut seats which will lock bearing seat in housing assembly.

Idler Lever—Idler lever on lower end of steering column is fitted with a bushing and pivots on a bolt on the idler lever bracket. When installing lever, make certain that spring washer and plain washer are in place between lever bushing and head of bolt to prevent rattles. Lubricate idler lever at regular intervals (lubricant fitting provided on bolt).

Transmission Case Shifter Mechanism—Selector shaft and shifter shaft mechanism (for gear engagement) similar to type used on 1940 cars with cross-shift selector lever and shaft (vertical shaft and small forward lever on transmission case). See separate Transmission article for disassembly and servicing directions. CAUTION — Selector shaft must be removed through right side of transmission case and installed on left side to avoid damage to oil seal.

CADILLAC TYPES

Used On:

SERIES 41-60S,61,62,63,67,75 (1941)

NOTE:—This control used only with Standard 3-speed synchro-mesh transmission. Control used with Optional Hydra-matic Transmission is different design and is adjusted as directed in Hydra-matic Transmission article.

TYPE:—Remote control type with steering column mounted gearshift lever. Same design as used on 1940 car models.

ADJUSTMENT:—Place gearshift lever in neutral position on Second-High side (normal position). Disconnect Low-Reverse rod at rear lever on transmission case, place lever in neutral (can be checked by feel of detent balls engaging notch in lever shaft sector), adjust rod length by loosening locknut and turning rod end until gearshift lever can be lifted freely into Low-Reverse position with rod connected and without disturbing position of transmission case shift lever. Then adjust Second-High rod (connected to forward lever on transmission case). To adjust this rod, place gearshift lever in neutral, disconnect rod, place transmission case lever in neutral, then adjust rod length so that it can be connected without disturbing position of either rod. Recheck low-reverse rod adjustment to insure smooth cross-over of shift lever from Second-High to Low-Reverse position at neutral.

Shifter Levers—To adjust lever positions on control tube and shaft, disconnect rods on levers, remove anti-rattle spring from second-high lever, install special tool No. J-1204 on lower end of Second-High control shaft, tighten thumbscrew on tool slightly. Loosen clampscrew on Second-High lever (lower lever), tighten thumbscrew on tool until 2 lbs. force required to move this lever back and forth (measure with spring scale attached to outer end of lever), tighten clampscrew and remove tool. NOTE—Low-Reverse (upper) lever does not require adjustment.

SERVICING:—Disassembly—Remove horn button or horn ring and steering wheel, remove anti-rattle spring (at lower end of control shaft). Loosen clampscrew and remove Second-High (lower) lever, loosen clampscrew on Low-Reverse (upper) lever, remove cross-over spring at upper end of control shaft. Loosen clampscrew holding upper shifter housing on steering column, disconnect three wires of direction signal switch, lift upper housing and shifter control assembly up and off steering column. Remove pin and collar on lower end of Second-High (inner) shaft, pull this shaft out of Low-Reverse tube at upper end. Remove gearshift lever and flat anti-rattle spring directly below lever, pull Low-Reverse tube out of housing.

Reassembly—Install Low-Reverse tube in housing with lug pointing away from center, install flat cross-over spring under gearshift lever, hold lever in position and install Second-High shaft. Slip one spring washer with convex side up over bottom end of second-high shaft and hold washer in place against end of low-reverse tube. Install collar at lower end of second-high shaft and press locking pin in place. Push housing assembly with shifting shaft and shifting tube down in place on steering column making certain that direction signal wires pass through hole in steering column bracket on instrument panel and that low-reverse shifter lever installed on end of low-reverse shift tube before entering tube in lower bracket (if bracket has been removed, re-install bracket and install small clip spring washer in bracket hole, then push shaft through bracket). Install one anti-rattle spring washer with concave side up on lower end of second-high shaft, install second-high lever. Position shifter housing below steering wheel so that clearance between underside of wheel hub and top of housing is 1/16". Install steering wheel, connect direction signal wires. Adjust shifter levers and shifter rods as directed above.

Lower Bracket Mounting—If lower bracket removed, make certain that clamping bolt washer on bracket engages slot in steering column. This is important to position bracket properly.

Shifter Shaft & Tube Replacement:—Adjustment between Low-Reverse (outer) tube and Second-High (inner) shaft maintained by collar on lower end of shaft. Shaft must be drilled for correct location of collar locking pin if either tube or shaft replaced. To locate collar pin hole in shaft, assemble control on bench without the two anti-rattle spring washers located between the collar and tube (upper washers). Pull shaft through tube until all clearance taken up between upper ends, place .021" feeler thickness between collar and lower end of tube, drill and ream for locking pin without disturbing position of collar (use #32 drill and ⅛" or .1245-.1255" reamer). Then assemble control as directed above making certain that spring washers properly installed.

CHEVROLET TYPE

Used On:

MASTER DELUXE AG, SPECIAL DELUXE AH ('41)

TYPE:—Vacuum assistor type with gearshift lever mounted on steering colunm and vacuum power cylinder mounted on bracket at left side of transmission case. Design same as used on 1940 models except for new Vacuum Cylinder mounting as follows:

Vacuum Cylinder Mounting Bracket—Bracket is separate part mounted on left side of transmission case by three bolts (was integral part of universal joint ball collar). This new mounting permits rear axle and universal joint to be disassembled without disturbing shift mechanism.

ADJUSTMENT:—If operation unsatisfactory or if shift mechanism dismantled for servicing, adjust as follows:

Steering Column Control Assembly—See Servicing data below for dimensions to which parts should be set up when assembled.

Selector Rod—Loosen check nut on selector rod adjustment (at lower end of steering column), pull selector rod forward as far as possible, adjust swivel on rod by screwing it up or down on rod so that distance between lower side of steering wheel and top of gearshift lever is 1 27/32" with selector rod connected to selector control lever. Install washer and cotter pin on swivel pivot and lock adjustment by tightening selector rod check nut.

Control Rod (Gear Engagement Rod)—Set gearshift lever in horizontal position, loosen checknut on control rod. Push control rod to rear until all clearance has been taken up and note location of swivel with reference to shift control lever, then pull rod forward until all clearance has been taken up and again note swivel location. Neutral valve position is midway these two positions. Hold control rod in this neutral position, adjust swivel position on control rod (screw swivel up or down on rod) until swivel pivot just enters hole in shift control lever. Install flat washer and cotter pin on swivel pivot, lock adjustment by tightening control rod check nut.

SERVICING STEERING COLUMN UNIT:—Gearshift Lever Removal—Lever can be removed without disturbing steering column assembly by shifting into Reverse, depressing pivot pins 3/32" and then lifting up and out on lever. To remove anti-rattle spring and pivot pin spring, compress legs of pivot pin spring and lift up. When reassembling gearshift lever, coat control shaft ball with graphite grease, install anti-rattle spring in control shaft ball and over neck of control shaft, thread pivot pins on ends of spring and in holes in gearshift lever swivel, thread gearshift lever over this assembly, compress pivot pins and press down on top of lever until pivot pins snap into place.

Disassembly—Disconnect gear engagement control rod and selector rod at lower end of steering column by taking out cotter pins and removing flat washers. Remove clamp bolt on shift lever at lower end of control shaft, remove lever and spring. Remove horn button and steering wheel nut, pull steering wheel (use puller J-1618 to protect shaft threads). Remove instrument panel steering column jacket clamp. Take out two screws in upper support on steering column jacket, pull control shaft and upper support up and out of lower support. If gearshift lever to be removed, see preceding paragraph for directions.

Lower Support Bushing Servicing—If bushing worn, press old bushing out, press new bushing in until distance from face of support to lower end of bushing is 19/64".

Reassembly—Screw gearshift lever swivel into upper support until shoulder on swivel extends approximately ⅛" above support. Install control shaft by threading it through upper support and swivel. Install gearshift lever (see above). Install lower support on steering column jacket and see that key engages slot, tighten clamp bolts just snug (excessive tightening will collapse jacket). Screw upper support up or down on swivel until clearance between lower edge of gearshift lever and top of support is 3/32-⅛". Thread toeboard grommet over control shaft, install control shaft through lower support and attach upper support to steering column by installing two screws. Install spring and lever on lower end of control shaft making certain that end of selector operating lever is engaged in slot on control shaft lever, install clamp bolt and tighten securely. With steering wheel removed, check distance from top of horn blowing ring on mast jacket to top of shoulder on steer-gear shaft. Distance should be 1¼" (plus 1/32", minus 0"). If not correct, loosen mast jacket clamp at steering gear housing, move mast jacket up or down as required, tighten clamp. Adjust Control Rod and Selector Rod (see Adjustment above). Check distance from upper face of control shaft lever to lower face of lower support bracket on steering column. If this distance not ¾", adjust by loosening lower support clamp bolts and moving support up or down on steering column.

CAUTION—Do not tighten support clamp bolts excessively which will collapse steering column jacket.

SERVICING TRANSMISSION LEVER LINKAGE:—Note—Reactionary lever assembly is of riveted construction and cannot be disassembled (service as an assembly).

Disassembly—Disconnect shift control rod from reactionary lever assembly, remove vacuum hose from vacuum inlet stack and slip forward end of rubber boot off rear end of metal boot. Remove two screws holding metal boot halves together, lift off outer half of boot. Take out piston rod yoke clevis pin, push cylinder rod into cylinder to disconnect it from reactionary lever, then re-install clevis pin to prevent valve adjustment being disturbed. Loosen operating lever clamp bolt, pull reactionary lever assembly off operating lever shaft, remove second half of metal boot.

Servicing—Clean reactionary lever assembly with clean gasoline, examine rubber seal at front of metal boot and replace if damaged.

Reassembly—Coat reactionary levers lightly with graphite grease, place inner half of metal boot on operating lever shaft, thread rubber seal over idler lever, install reactionary lever assembly on operating lever shaft to point just beyond chamfered end of shaft and tighten clamp bolt. Pull piston rod forward and connect yoke and valve link to reactionary levers, install piston rod valve clevis pin. Assemble outer half of metal boot and install the two retaining screws. Slip end of rubber boot over rear end of metal boot, install vacuum hose and shift control rod.

SERVICING VACUUM CYLINDER:—Removal—Disconnect vacuum and air hose, remove outer half of metal boot and disconnect piston rod and valve links from reactionary levers (see Servicing Transmission Lever Linkage above for directions). Take off cotter pin and nut on cylinder mounting stud, remove vacuum cylinder.

Installation—Install rubber cushion and steel retainer on mounting stud, insert stud through hole in bracket, install steel retainer, rubber cushion, flat washer and nut on stud, tighten nut just sufficiently to allow cotterpin to be installed (mounting must be flexible). Connect piston rod yoke and valve link to reactionary levers, install vacuum and air hoses.

Vacuum Cylinder Lubrication:—Must be removed from car as directed above (cannot be lubricated on car). Stand the cylinder on the mounting end, pull valve link forward to open valve, pour ½ oz. shock absorber insulating fluid into cylinder through vacuum inlet stack. Push valve rod into cylinder as far as possible, pour additional ½ oz. of fluid into vacuum inlet stack. Allow time for fluid to flow into cylinder, then work piston rod in and out several times and turn rod at same time to spread fluid over cylinder walls and piston leather. NOTE—Cylinder can be washed out by following directions given above using 2 ozs. of fluid and draining fluid by inverting cylinder and moving valve rod until fluid flows out. Repeat until fluid drained from cylinder is clean (cylinder need not be lubricated after this process completed).

Vacuum Cylinder Valve Adjustment:—If vacuum valve adjustment disturbed by dismantling or servicing operations, adjust as follows: Disconnect piston rod and valve link from reactionary levers (see Servicing Transmission Lever Linkage above for directions). Install special adjusting bushing J1452-5 within valve link and re-install clevis pin. Run engine to provide vacuum source. Move valve link out or away from cylinder until all clearance between link and adjusting bushing is toward front of car, piston rod should move out of cylinder slowly in this position. Then move link in toward cylinder until all clearance between link and adjusting bushing toward rear of car, piston rod should move into cylinder in this position. If piston rod moves out but does not move in, valve link should be screwed out on valve rod. If piston rod moves in but does not move out, valve link should be screwed in on valve rod. To adjust, remove clevis pin and change valve link position ½ turn at a time until correct operation is secured.

Valve Friction Spring Installation:—To install spring, remove outer half of reactionary lever boot and disconnect reactionary levers from vacuum cylinder (see Transmission Lever Linkage Disassembly directions above), pull out on valve rod in vacuum cylinder, snap friction spring in place on rod midway between valve and valve rod guide with closed end of spring toward back of cylinder, push valve rod back into place, connect reactionary levers and replace metal boot.

NOTE—This spring necessary to prevent 'flutter' in gearshift lever at idling speed.

Air Cleaner Servicing:—At 10000 mile intervals, remove cleaner, wash in gasoline, and dip in engine oil before re-installing.

STANDARD TYPE

Used On:

CHRYSLER, MODELS C28,C30,C33 (1941)
DE SOTO, MODEL S8 (1941)
DODGE, MODEL D19 (1941)
PLYMOUTH, MODELS P11, P12 (1941)

NOTE:—Power Shift—Power shift with vacuum power cylinder is Optional Equipment on all models. This type is adjusted differently. See separate article (following) for Power Shift adjustment.

Vacamatic Underdrive (Chrysler) & Simplimatic Underdrive (DeSoto) Transmission—Special controls are used in conjunction with these optional transmissions. See Transmission articles for adjustment directions.

TYPE:—Remote control type with gearshift lever mounted on steering column. Steering column unit is new design (not same as 1940 type) with gearshift rod at right side of steering column (not within column jacket as on 1940 cars). On all models except Plymouth, steering column and shift rod are enclosed by additional casing extending from upper lever pivot bracket to edge of instrument panel. Gearshift lever is mounted on bushing in pivot bracket (shift control rod slotted at this point to clear bearing) so that the lever pin engages the yoke on the outer end of the control rod. Control rod is mounted in bushings at upper and lower ends (upper bushing in gearshift lever pivot bracket, lower bushing in mounting collar on steering column jacket). Gear engagement lever bolted on lower end of control rod is linked to shift lever on transmission case by two rods with an idler lever mounted on bracket on flywheel housing between the front and rear rods (this idler lever not used on Dodge and Plymouth models with one shift rod only). A collar on the lower end of the control rod engages the selector lever pivoted on the steering column and linked to the cross-shift lever on the transmission case by a single rod. A spring installed on the control rod below the steering column bushing collar holds the control rod down so that the selector lever and rod is in the Second-High position except when gearshift lever is raised for Low-Reverse engagement which pulls control rod up against spring tension and rotates the selector lever and rod to the Low-Reverse position.

Transmission Case Shifter Mechanism—Same design as used on 1940 cars. Refer to Chrysler Transmission article for servicing data.

ADJUSTMENT:—Control Rod (Gear Engagement) — Loosen nut on control rod connector stud on lever at lower end of steering column control rod, make certain that transmission gears and shift lever are in neutral position (can be determined by feel of detent balls engaging neutral notches in shifter shafts), see that steering column gearshift lever is horizontal, tighten stud nut securely (stud hole in lever is slotted to permit this adjustment).

Selector Rod (Cross-shift)—See that transmission gears are in neutral position. Adjust selector rod as follows: On all models except Plymouth, loosen locknut on forward end of selector rod at trunnion on steering column selector lever, tighten adjusting nut until all play removed from rod and lever, then back nut off ½ turn to provide correct operating clearance, tighten locknut. On Plymouth, loosen locknut on rear end of selector rod at transmission case cross-shift lever, tighten adjusting nut on rod to take up all play, back nut off ½ turn and tighten locknut.

SERVICING:—Disassembly—Remove horn button, horn wire and steering wheel. Disconnect selector rod and gearshift rod at steering column. Take off nut on lower end of control rod and remove rod end (selector lever collar), lever and spring from lower end of rod. Take out two screws attaching gearshift lever pivot bracket to steering column (except Plymouth). On Chrysler models, gearshift lever and control rod can then be withdrawn at upper end of steering column. On DeSoto & Dodge, remove attaching bolts and separate steering column bracket at dash, then withdraw gearshift lever and control rod as an assembly. On Plymouth models, remove gearshift lever (see below), then withdraw control rod at upper end without disturbing lever pivot bracket. Install control rod in same manner and adjust rods as directed above.

Gearshift Lever Removal—To remove lever from control rod, remove shift lever bearing and screw from lever and pivot bracket. Press down on end of lever so that end clears control rod, then pull lever out to disengage lever pin from fork on rod. Install lever in same manner.

POWER SHIFT TYPE

Optl. Equipment On:

CHRYSLER, MODELS C28, C30 (1941)
DE SOTO, MODEL S8 (1941)
DODGE, MODEL D19 (1941)
PLYMOUTH, MODELS P11, P12 (1941)

TYPE:—Power shift consists of a vacuum power cylinder linked to the gear engagement rod at the transmission case so that all of the effort required to shift gears is supplied by the power cylinder. Power is not used for the selector rod or cross-shift mechanism and this operates in the same manner as on the standard manual gearshift.

Steering Column Control—Design is same as used on cars without power shift (see preceding article) and is serviced in same manner. Adjustments are not made in same manner and rods should be adjusted as directed below.

Power Linkage—Consists of a valve lever, reaction lever and relay lever assembly pivoted on a shaft on a bracket bolted on the left side of the transmission case. Control rod from steering column control rod lever is linked to valve lever and an additional short non-adjustable rod is linked between the relay lever and the shift lever on the transmission case.

Power Cylinder—Consists of an internal-valve type vacuum power cylinder mounted on a bracket at the left of the transmission case with the piston rod linked to the relay lever so that power is applied to transmission case shift lever. Control valve is located within piston rod with valve rod extending out though piston rod and linked to lever assembly. Vacuum line (from manifold) is connected to inlet pipe extending out through side of piston rod boot and air intake hose from cylinder is connected to air cleaner mounted on frame.

ADJUSTMENT:—See important Caution below when making adjustments. Before making adjustments, see that all linkage moves freely and does not bind at any point, lubricate all linkage bearing points. See that piston rod boot is intact and that vacuum line and air line connections are tight. Examine air cleaner and clean filter element if required. Make Neutral Adjustment and also adjust valve if gear engagement is slow or sluggish in either direction (Low & High or Second & Reverse).

Power Cylinder Valve Adjustment—To adjust valve, remove piston rod boot, take out valve rod clevis pin (which links valve rod clevis to lever assembly), shorten valve rod by turning clevis in on rod (if Low or High shift sluggish), lengthen valve rod by turning clevis out on rod (if Second or Reverse shift sluggish) one-half turn at a time, reconnect valve rod by inserting clevis pin and check performance (too much adjustment will cause shift to be sluggish in the other direction). Repeat adjustment until performance is satisfactory in both directions. If proper performance cannot be secured, lubricate power cylinder (see Servicing below) or replace power cylinder assembly.

Neutral Adjustment—This adjustment properly locates boss on detent spring (mounted on lever bracket) in relation to notch in valve lever which is connected to steering column shift control rod. Adjust with engine running to supply vacuum and with rear wheels jacked up so that car will not move if gears are engaged. Disconnect selector rod and loosen detent spring mounting bolt (see Note below). Move power lever and links back and forth slightly and at same time move selector lever until a positive and clean 'cross-over' is felt at neutral position. Hold levers in this position, move detent spring so that boss indexes with notch in lever and tighten detent spring bolt. Connect selector rod and adjust this rod as follows: On all models except Plymouth, loosen locknut and tighten adjusting nut on forward end of selector rod (at trunnion on steering column selector lever) until all play has been taken up in rod and lever, then back off nut ½ turn for correct operating clearance and tighten locknut. On Plymouth, loosen locknut at rear end of selector rod (at transmission case cross-shift lever), tighten adjusting nut until all play taken up, then back off nut ½ turn and tighten locknut. Check performance.

Detent Spring Note—Two types of detent springs have been used. First type consisted of a flat spring with boss for lever notch engagement. Second type consists of a ball and spring assembly to provide more positive detent action. Both types are adjusted alike as directed above.

ADJUSTMENT CAUTION—Always jack up rear wheels free of floor and securely block in this position when making adjustments. This is particularly important when running engine to supply vacuum for power shift performance tests as tests may result in gear engagement which would cause car to move. This is particularly important if work being performed under car.

SERVICING:—Power shift serviced as a unit and service parts furnished for boots and linkage only. Vacuum power cylinder should be serviced by replacement as a unit.

Power Cylinder Lubrication — Power cylinder must be removed from engine for lubrication. To remove, remove leather boot, disconnect vacuum line and air cleaner line at cylinder. Take out power pin linking piston rod yoke to relay lever (pin should be re-inserted as soon as lever freed from yoke to prevent valve clevis turning on rod which would disturb valve setting). Remove nut on anchor stud at mounting bracket on rear end of cylinder, remove cylinder from engine. Clamp cylinder in bench vise in horizontal position (clamp at mounting stud). Locate piston rod in midposition, press in on valve rod and pour ½ oz. of shock absorber fluid or ice machine or transformer oil

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

in vacuum inlet pipe. Allow sufficient time for oil to run down into cylinder, pull out on valve rod and pour in additional ½ oz. of oil. This will lubricate both sides of piston. Work piston through full travel several times, rotate piston in cylinder meanwhile so that oil distributed over entire cylinder and piston packing surfaces. Re-install power cylinder on car.

Air Cleaner—Should be cleaned and re-oiled at 15000 mile intervals or more frequently if car operated in dusty territory. To service cleaner, remove two screws mounting cleaner on frame, remove cleaner element, clean element in kerosene, re-oil by dipping in SAE. #50 engine oil and re-install on car.

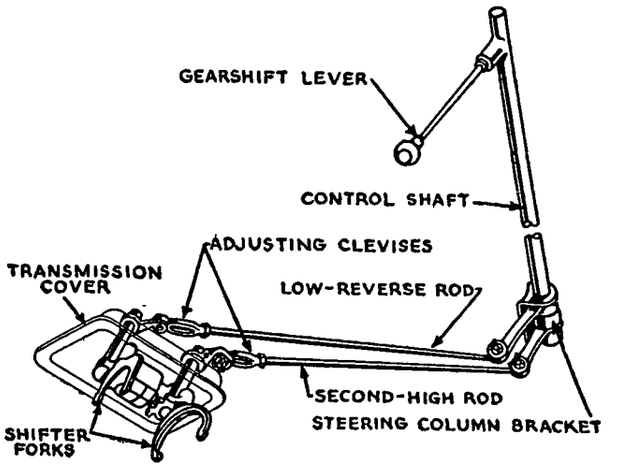
Transmission Case Shifter Mechanism — Same type as used on cars with standard shift control. See Chrysler Transmission article for servicing data.

FORD, LINCOLN, MERCURY TYPE

Used On:

FORD, MODEL 11A PASS. CARS (1941)

LINCOLN, MODELS 16H, 168H (1941)



MERCURY, MODEL 19A (1941)

TYPE:—Remote control type with steering column mounted gearshift lever. Used in connection with transmission having special shifter mechanism on transmission case side cover which consists of separate Low-Reverse (rear) shift lever and Second-High (front) lever. Steering column unit consists of a control tube with a clutch pin at the lower end which normally engages the lower (second-high) lever on the steering column. When the gear shift lever is raised to engage Low or Reverse, the control tube is lifted up so that the clutch pin engages the upper (Low-Reverse) lever. These levers are connected to shift levers on transmission case by control rods with adjusting clevis at transmission case end.

ADJUSTMENT:—Adjustment should be checked whenever steering column position is changed or when linkage disconnected. Before making adjustments, make certain that both shift levers on transmission case are in neutral with detent balls engaging neutral notch in shifter shaft sectors (can be determined by feel with control rods disconnected). Disconnect Low-Reverse control rod at rear lever on transmission case, loosen locknut and adjust clevis on end of rod so that gearshift lever moves up and down freely (cross-shift at neutral) with control rod connected. Second-High control rod will not ordinarily require adjustment. Make certain that gearshift lever has full travel in both directions so that gears are fully engaged (detent balls should engage end notches in shifter shaft sectors with gears engaged).

SERVICING:—Steering Column Unit—Steering column unit is mounted on steering column by retainer clamped in bracket bolted on column and can be dismantled after bracket has been loosened and retainer setscrew removed. Gearshift lever is pivoted on pin in control tube elbow and inner end engages fulcrum pin within upper end of control tube. If assembly dismantled, make certain that spring installed at lower end of fulcrum pin and that bushing and boot installed on upper end of fulcrum pin when it is reassembled. Sleeve type insulator should be installed on end of gearshift lever before lever is installed.

Transmission Case Shifter Mechanism—See Transmission article for servicing data.

HUDSON TYPE

Used On:

SIX, MODELS 10, 11, 12, 18 (1941)

EIGHT, MODELS 14, 15, 17 (1941)

TYPE:—Remote control type with steering column mounted gearshift lever. Design same as used on 1940 models except as follows:

Steering Column Unit—Cross-shift control cable ends protected by boots at both steering column and transmission case ends. Operating rod (gear engagement rod) has new type ends with adjusting clevis at forward (steering column) end of rod.

Transmission Case Shifter Mechanism — New type design used in conjunction with new synchro-mesh transmission. Gears are engaged by lever on inner end of shaft in side of transmission case which engages upper or lower shifter rail in case. This shaft and lever are shifted in or out (for cross-shift at neutral) by an inner lever on a vertical cross-shift shaft. Selector cable is connected to outer lever on this vertical shaft.

ADJUSTMENT:—Operating Rod (Gear Engagement)—With gearshift lever and transmission gears in neutral position, disconnect operating rod at lever on steering column by removing cotter pin and clevis pin, loosen locknut and turn clevis on rod until clevis pin can just be installed without disturbing position of transmission case shift lever and with gearshift lever in neutral and at right angles to centerline of car. Tighten locknut and connect rod.

Selector Cable (Cross-shift)—Place steering column shift lever in Low-Reverse or 'up' position at neutral and block in this position while adjustment being made. Loosen selector cable conduit bracket capscrew at lower end of steering column and move conduit bracket up until all slack removed from cable and shift lever at transmission case is fully over in Low-reverse position (lever to rear), tighten bracket capscrew securely. See that anchor on steering column end of cable (at lower end of control lever pushrod) has clearance at top and bottom of travel.

SERVICING:—Removal of steering column unit requires that horn button and steering wheel be removed first. Steering column can then be serviced as follows:

Gearshift Lever Removal—Remove control tube upper bracket clamp bolt (use Phillips type screwdriver), remove upper bracket and fulcrum bracket ring. Use Allen wrench to remove control lever fulcrum, withdraw lever and anti-rattle washer. Remove selector cable anchor (at lower end of steering column unit), push end of pushrod up for access to control lever upper end. Assemble in same manner applying small amount of viscous chassis grease to bracket before installing.

Steering Column Unit—Remove front seat cushion, accelerator pedal, floor mat, transmission opening cover, horn button and steering wheel. Disconnect control rod at steering column end, remove selector cable anchor bracket bolt, remove cable anchor and jacket tube bracket cap, pull jacket tube and control tube off steering column tube. Remove control tube upper bracket clamp bolt (Phillips type screw-driver), bracket, and bracket ring. Remove gearshift lever (see above). Remove fulcrum bracket setscrew, mark control tube and fulcrum bracket (to insure reassembly in same relative positions), press tube out of bracket. To remove lower bracket, remove clamp bolt and slide bracket off. Reassemble in same manner being careful to line up marks on control tube and fulcrum bracket. Adjust control rod and selector cable as directed above.

Transmission Case Shifter Mechanism—Refer to Hudson Transmission article for servicing data.

NASH TYPE

Used On:

AMBASSADOR '600', MODEL 4140 (1941)

AMBASSADOR SIX, MODEL 4160 (1941)

AMBASSADOR EIGHT, MODEL 4180 (1941)

TYPE:—New design remote control type with steering column mounted gearshift lever. Steering column unit consists of a single control shaft mounted in upper and lower brackets on steering column with key in lower end which engages one or the other of the two levers mounted on the lower bracket. These levers are linked to shifter shaft levers on transmission case by rods which have adjustment at transmission case end. Control shaft is normally held down in the lower position (engaging lower Second-High lever) by a spring installed on the lower end of the shaft. Shaft is raised so as to

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

engage upper Low-Reverse lever by lifting up on gearshift lever (lever pivots on bearing screwed in upper bracket and engages integral arm on upper end of control shaft).

ADJUSTMENT:—With gearshift lever in neutral, install special aligning pin J-1390 through holes in both flanges of steering column lower bracket and through holes in both levers so that levers are aligned in this neutral position. Loosen locknut and back off setscrew on each rod trunnion on transmission case shifter shaft levers. Carefully position each shifter shaft so that gears are in neutral (can be determined by feel of detents engaging neutral notch in sector on inner end of shafts), tighten setscrews securely and lock with locknuts. Remove aligning pin.

SERVICING:—**Caution**—Do not remove two screws in control shaft upper bracket on steering column below gearshift lever unless steering column jacket is disassembled from steering gear. These screws thread into loose tapped plate within jacket and this plate will drop down out of position if screws removed so that steering gear must be disassembled in order to re-install screws.

Steering Column Unit—Disconnect rods at levers on steering column, remove cotter pin in lower end of control shaft, remove plain washer, pull-down spring, rubber sleeve, and second washer from end of shaft. Raise control shaft up to engage Second-High lever, then rotate shaft until key lines up with slot in upper flange of lower mounting bracket, raise shaft up and free of lower bracket. Control shaft can then be removed from upper end (with steering wheel removed) by removing key from shaft and loosening setscrew in limiting plate so that plate will slide off lower end of shaft as shaft withdrawn through upper mounting bracket. CAUTION—Do not remove upper bracket mounting screws—see Caution note above.

Gearshift Lever & Upper Bracket—Lever pivot consists of pointed setscrew and nut installed in lever and upper bearing. When installing lever, make certain that anti-rattle grommet installed on end of control shaft arm, tighten clampscrew in upper bracket for minimum clearance between bracket and threaded bearing without binding.

Lower Bracket & Lever Assembly — If lower bracket removed from steering column, make certain that locating tongue on bracket engages hole in jacket tube when bracket installed. Install bracket with slotted hole uppermost. See that levers and spring installed properly (fibre washer between each lever and bracket flange, spring within bearing tube between levers). Install pulldown spring and washer assembly on lower end of control shaft and install cotter pin.

Limiting Plate Adjustment—Must be adjusted so that control shaft selector key does not rub on lower flange of mounting bracket. To adjust, loosen locknut and back off adjusting setscrew. Engage control shaft with Second-High lever fully, then raise shaft slightly to provide clearance between key and lower flange of bracket, position limiting plate so that rubber cushioning washer is against top flange of bracket, tighten setscrew and lock with locknut.

OLDSMOBILE HANDI-SHIFT

Used On:

SIX, MODELS 66, 76, 96 (1941)

EIGHT, MODELS 68, 78, 98 (1941)

NOTE:—This control used with Std. 3-speed synchromesh transmission. Control used with Optl. Hydra-Matic Transmission is different design and is adjusted as directed in Hydra-Matic Transmission article.

TYPE:—Remote control type with steering column mounted gearshift lever. Design same as used on 1940 car models except for new shift rod linkage as follows:

Control Rod (Gear Engagement) Linkage—New relay lever (idler lever) mounted on left side of engine with front non-adjustable rod connected between this idler lever and lever on steering column and additional rear adjustable rod connected between idler lever and gear shift lever on transmission case. Rear rod has adjusting clevis on transmission case end.

ADJUSTMENT:—**Selector Rod (Cross-shift)**—See that shift lever and transmission gears in neutral, check vertical distance from top of gearshift lever to lower face of steering wheel rim. This distance should be 2 11/16—2 13/16". To adjust, remove cotter pin and take out lock pin in lever which engages adjusting screw on lower end of selector rod, turn adjusting screw up to reduce lever-to-wheel distance, down to increase this distance. Install lock pin from engine side making certain that it passes through waved spring washer on inside of lever, install cotter pin.

Control Rod (Gear Engagement)—With transmission gears in neutral, gearshift lever should be approximately ½" above horizontal position. To adjust, disconnect shift rod at lever on transmission case (upper gear engagement lever), see that this lever in neutral position (can be determined by feel of detent balls engaging notches in shifter shafts). Install special aligning gauge J-1609 over lower end of control shaft and steering column so that notch in gauge engages control shaft lever (gauge will hold gearshift lever and shaft assembly in correct neutral position which is ½" above horizontal). Loosen locknut and turn adjusting clevis on transmission end of shift rod until clevis pin can just be inserted without disturbing position of transmission shift lever. Tighten locknut and connect rod, remove gauge. NOTE—This adjustment should be made each time shift rod is disconnected at either end. Improper adjustment may cause interference with brake pedal.

SERVICING:—**Gearshift Lever**—To remove lever, slide rubber cover toward outer edge to expose retainer ring, remove retainer ring, take out shift lever pivot pin, remove lever being careful not to lose shims and washers between lever and bracket. When reinstalling lever, make certain that anti-rattle spring in place on inner end of lever and that spring washer installed on pin on one side of lever and install shims (as required) on opposite side of lever so that lever operates freely without excessive sideplay or rattles.

Transmission Case Shifter Mechanism—Selector shaft and shifter shafts (for gear engagement) are same design as used on 1940 models. See Transmission article for dismantling and servicing directions. CAUTION—Selector shaft must be removed through right side of case and installed on left side to avoid damage to oil seal. Lower lever must be removed from vertical cross-shift shaft before selector shaft is driven out (to permit upper lever on shaft to disengage from selector shaft).

PACKARD TYPE

Used On:

CLIPPER MODEL 1951 (1941)

'110' SIX, MODEL 1900 (1941)

'120' EIGHT, MODEL 1901, 1A (1941)

'160' SUPER EIGHT, 1903, 3A, 4, 5 (1941)

'180' CUSTOM SUPER EIGHT, 1906,7,8 (1941)

SPECIAL SERVICE CAUTION:—Always insert 3/16" lock pin aligning gauge through holes in both levers at lower end of control tube on steering column when working on engine in proximity to control rods and levers to prevent accidental gear engagement which would prevent operation of gearshift lever until gears and rods had been reset in neutral.

TYPE:—Remote control type with steering column mounted gearshift lever. Same design as used on 1940 car models except as follows:

High Gear Steering Column Lever Stop—Consists of an adjustable rubber bumper on steering column bracket which engages lever in third or high gear position so as to take up all slack in linkage. See Adjustment directions below.

Idler Lever Assembly—Second & High Idler Lever mounted on roller bearings on bracket shaft mounted on brake master cylinder (Low & Reverse idler lever mounted on plain bushings). Bearings are packed with lubricant at assembly and require lubrication only when disassembled. Over-center type assist spring is used on Second & High Idler lever (not used for Low & Reverse lever).

ADJUSTMENT:—See that gearshift lever in neutral, install 3/16" rod through alignment holes in both levers at lower end of control tube on steering column and leave this pin in place while adjustments being made. Disconnect both control rods at levers, place both shifter levers on transmission case in neutral position (this can be determined by feel of detent balls engaging neutral notch on each shifter lever shaft sector within transmission). Adjust each control rod at bellcrank (loosen locknuts and turn adjusting sleeve on upper rod, adjusting clevis and locknut also provided at bellcrank end of lower rod) so that lengths are correct and rods can be connected without disturbing position of shift levers, connect rods and remove pin from alignment hole in levers.

High Gear Lever Stop Adjustment—Loosen locknut and adjust stop by turning mounting stud so that rubber cap on stop is compressed at least ⅛" with shift lever and transmission gears in 3rd. speed or High Gear position.

PONTIAC SAFETY-SHIFT

Used On:

SIX, MODELS 41-24, 25, 26 (1941)

EIGHT, MODELS 41-27, 28, 29 (1941)

SPECIAL SERVICE NOTES & PRODUCTION CHANGES:—Streamliner & Custom Torpedo Models 41-24,26,28,29. New type single shifter rod (between steering column lever and shift lever on transmission case) used on these models beginning with the following Serial Numbers:

	Pontiac	Linden	South Gate
41-24	P6JB-25488	L6JB-6379	C6JB-4044
41-26	P6JC-4884	L6JC-2404	C6JC-1789
41-28	P8JB-19031	L8JB-4349	C8JB-3246
41-29	P8JC-7794	L8JC-3274	C8JC-1957

Installing New Single Rod on First Cars—New type single rod furnished for service replacement on all cars. When installing new single rod on first cars (with front and rear rods and intermediate idler lever), proceed as follows: Remove clutch and brake pedal toe plate, cut off shifter rod idler lever bracket and re-install plate. Install the following new parts—506712 Gearshift Control Rod, 506713 Transmission Shifter Lever, 505760 Gearshift Control Shaft Idler Lever (these are levers to which rod attaches at front and rear ends). Discard old parts.

Hard Shifting Complaints—To correct complaints, examine linkage and make following corrections:

Rear Shift Rod Alignment—On cars with front and rear control rods and intermediate idler lever, check rear shift rod and see that ends are parallel so that rod does not bind in transmission shift lever as gears engaged. See note above for installation of new type single rod to replace this double rod and idler lever assembly.

Idler Lever Bracket—Check idler lever bracket for looseness allowing lever to bind on rods. If bracket loose at mounting rivets, remove toe plate and securely weld bracket or remove idler lever and install new type single rod.

Control Shaft Toeboard Grommet—See that rubber grommet on steering column and shift control shaft at toeboard does not bind on shaft and prevent free up-and-down movement (required for cross-shift at neutral). Correct by trimming rubber at point where bind occurs and applying few drops of brake fluid to shaft.

Control Shaft & Gearshift Lever Clearance—If shoulders on shaft not machined low enough, they will strike gear shift lever fulcrum cups and prevent full Low and Reverse gear engagement causing hard shifting. To check this dimension, remove control shaft, place small square on shaft so that upper edge even with tops of shoulders on shaft, measure perpendicular distance from top of square to bottom of fulcrum ball on end of shaft. Distance should be 1 1/16". If incorrect, rework shaft as follows: If over-all length of shaft (from lower end to tops of shoulders at upper end) is more than 32 11/32"±1/32", file shoulders down to secure correct 1 1/16" fulcrum ball height. If over-all length of shaft within limits given above, bend ball end of shaft to secure correct fulcrum ball height.

TYPE—Remote control type with steering column mounted gearshift lever. Same design as used on 1940 cars except for control rod on some models (see Production Change Note above).

ADJUSTMENT:—Gearshift Lever Clearance—Clearance between upper edge of control shaft upper support and shoulder on upper control shaft bearing which is screwed in the bracket must be ⅛" minimum, 5/32" maximum, to avoid interference when engaging gears. If clearance incorrect, adjust by removing gearshift lever (see Servicing data below), screw bearing in or out of support bracket.

Selector Rod (Cross-shift)—With gearshift lever in neutral on Second-High side (normal position), distance from lower edge of steering wheel rim to upper edge of gearshift lever should be 2⅞" (plus or minus ⅛"). To adjust, loosen clamp bolt holding selector control lever and selector control idler lever together (these are levers pivoted on lower suport bracket on steering column), see that selector rod and levers are in Second-High position (rod moved to rear as far as possible), place gearshift lever in correct position and tighten lever clamp bolt.

Control Rod (Gear Engagement)—With gearshift lever in neutral, lever should be approximately horizontal but can be varied approximately 1½" to suit individual operators. To adjust, loosen clamp bolt holding control shaft lever and control shaft idler lever together (these are levers mounted on lower end of control shaft on steering column), see that control rod and transmission case shifter lever are in neutral, move gearshift lever to desired position and tighten lever clamp bolt. Check to make certain that gearshift lever has full travel required for gear engagement without interference after making this adjustment.

SERVICING:—Disassembly—Remove front compartment floor mat, center floor panel, and steering wheel (use puller J-452). Remove gearshift lever using tool J-1044 to remove shift lever pins and springs, use care not to lose spring washer and shims, disconnect return spring hooked to clip on lower end of control shaft, remove selector control lever pivot pin. Take out screw in lower end of control shaft, remove selector lever collar, control shaft lever and idler lever assembly from shaft. Remove screws in upper support bracket at upper end of control shaft (use Philips #2 screwdriver). Pull upper support and control shaft assembly up parallel to steering column and lift out being careful not to lose anti-rattle spring and spring cup (in upper support), flat anti-rattle spring (in lower suport).

Reassembly—Reassemble by reversing disassembly directions given above. Make certain that anti-rattle spring installed in lower support bracket and upper support bracket (spring and cup must be installed in upper bracket before bracket mounted on steering column). Lubricate all moving parts (including anti-rattle springs) with Lubriplate before assembling. Use caster oil in insulators at rod connections in levers (oil or grease will cause insulators to swell and bind on rods).

Gearshift Lever Assembly—One anti-rattle spring washer must always be used on gearshift lever pivot pin and shims should be installed as required to take up excessive clearance so that lever operates freely without excessive play or rattles.

Transmission Case Shifter Mechanism—Selector shaft and shifter shafts (for gear engagement) similar to design used on 1940 car models. See separate Transmission article for dismantling and servicing instructions. CAUTION—Selector shaft must be removed through right side of case and installed on left side to avoid damage to oil seal. Lower lever must be removed from vertical cross-shift shaft before the selector shaft is driven out (to permit upper lever on shaft to disengage from selector shaft).

STUDEBAKER TYPE

Used On:

CHAMPION, MODEL 3G (1941)

COMMANDER, MODEL 11A (1941)

PRESIDENT, MODEL 7C (1941)

SERVICE TOOL NOTE:—Gauge No. J-1308-A required for transmission control adjustment. This gauge is same type used on 1940 models and differs from first type used on Champion cars (see Service Tool Note in 1940 Supplement).

TYPE:—Remote control type with steering column mounted gearshift lever. Same design as used on 1940 models.

ADJUSTMENT:—Pry out inspection plug in engine side of control housing cover on steering column at lower end of control shaft, insert forked end of adjusting gauge J-1308-A (see service tool note above) in hole and press up on control shaft until gauge prongs enter above and below the selector lever on the control shaft which hold control levers and shaft assembly in neutral position while adjustments are being made. Disconnect both connecting rods at shift levers on side of transmission case, place each lever in neutral position (can be determined by feel of detent balls engaging neutral notch in shift lever shaft sectors). Loosen locknut and adjust clevis on transmission end of each rod so that clevis pins can be inserted without disturbing lever positions, tighten locknuts and connect rods. Remove gauge and replace inspection hole cover.

SERVICING:—If control mechanism removed from steering column, coat upper bracket pin threads and shift lever ball with Lubriplate, turn pin into upper bracket so that end of thread on pin is flush with lower face of bracket. Make certain that key on lower control housing mounting bracket engages notch in steering column. Adjust rods as directed above when control re-installed on car.

Lubrication—Lubricate gear shift control box on steering column at 10000 mile intervals using chassis lubricant.

WILLYS TYPE

Used On:

AMERICAR & PLAINSMAN MODEL 441 (1941)

WILLYS COMM'L. MODELS 441, 441P (1941)

TYPE:—Remote control type with gear shift lever on control shaft under steering wheel. Shaft has dog clutch at lower end (pin in shaft engages slots in levers) by which it is engaged with upper lever (connected to rear lever on transmission case) for Low-Reverse, or lower lever (connected to front lever on transmission case) for Second-High engagement. Control rods connecting steering column levers and transmission case levers have adjusting clevises at transmission case end.

ADJUSTMENT:—Disconnect both control rods at transmission case levers by removing clevis pins, make certain that both levers are in neutral position (can be determined by feel of detents engaging notches in shifter lever shaft sectors). Place steering column shift lever in neutral position, install aligning tool (short piece of ¼" drill rod) through hole in each lever and hole in boss on steering column clutch

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

housing (at lower end of control shaft) to hold levers in neutral position while adjustment being made. Loosen locknut and adjust clevis at transmission end of each control rod until clevis pin can just be inserted without disturbing position of transmission case lever. Tighten locknut and install clevis pin. Remove aligning tool. Check operation. If shaft pin strikes edges of slots in lever clutches, disconnect low-and-reverse control rod at transmission lever (rear lever) and lengthen or shorten rod slightly so that shaft pin engages both clutch slots smoothly.

SERVICING:—Removal & Installation—To remove assembly from steering column, remove steering wheel, remove floor boards, disconnect control shaft dampener at cowl. Assembly can then be removed by taking out gearshift lever and freeing housing assembly clamp bracket at lower end of steering column. When re-installing, note following points:

Clutch Clearance—Clearance between faces of shift clutches must be .015-.031" (1/64" to 1/32"). Can be checked by removing lubrication fitting on clutch housing and inserting narrow feeler gauge through this hole. If clearance not correct or if clutch assembly has been dismantled, check clutch pin clearance in slots (must not exceed .009"—replace Clutch Lever and Housing Assembly #116221 if clearance excessive) and set up levers as follows: Screw upper clutch lever in housing as far as possible, then back lever out one full turn until alignment holes line up. Then screw lower clutch lever into housing until clutch face contacts upper clutch lever face, then back off lever exactly ¼ turn which will give correct clearance of .015-.031" between clutch faces. If alignment holes do not line up in this position, remove lower clutch lever and grind off clutch face squarely not more than .015". It is very important that lower clutch lever be backed off exactly ¼ turn from position where it contacts upper clutch lever and that alignment holes line up in this position. If correct clearance between clutch faces cannot be secured by this method, or if control shaft clutch pin has more than .009" clearance in clutch slots, replace entire Clutch Lever and Housing Assembly #116221.

Control Shaft Bracket Position—When installing steering column assembly, see that steering gear outer casing or jacket is positioned so that gear shift control shaft clutch pin bottoms in upper clutch slot when gear shift lever and shaft is in the uppermost position (Low-Reverse). If jacket and brackets installed too far down on steering gear shaft, gear shift control shaft will bottom in upper bracket and prevent clutch pin fully disengaging from lower (Second-High) clutch slots.

Gearshift Lever Clearance—Lever sideplay at fulcrum pin must not exceed .005" (excessive play will cause rattles). To reduce sideplay, add thin washer (.005-.010") under head of fulcrum pin or grind down shoulder on pin so that it will squeeze stamping closer to lever when installed. Also see that anti-rattle trigger spring on gearshift lever has suffcient tension on lever to dampen rattles.

TROUBLE SHOOTING:—Shift not smooth and positive—Adjust control rod lengths (see Adjustment above).

Shift sticks or does not disengage—Check adjustment. If adjustment does not correct trouble, check Clutch Clearance (Servicing—above) and adjust clearance or replace Clutch Lever and Housing Assembly.

NOTE:—Steering Column Gearshifts—Standard equipment on all models except Bantam and Crosley models. See separate 'Transmission Control' articles for servicing and adjustment data on each car model.

Overdrive—Transmissions with Overdrive optional on all models except Bantam and Crosley. See following articles on Warner Overdrive for data on Overdrive Transmissions.

1940 SPECIAL SERVICE NOTES:—Studebaker Champion ('39-40). To correct shifting into 2 gears at once which may occur on '39 and early '40 cars when gears shifted forcibly with car standing still or with heavy lubricant, install special No. 199652 Interlock assembly as follows: Remove transmission cover drive out pin in low-reverse shaft pull shaft out of case as far as possible, remove old detent plungers and spring, install new assembly, reassemble transmission. When installing low-reverse shaft pin, coat pin with shellac and drive pin in ⅛-3/16" beyond surface of pin hole. NOTE—This trouble should not be experienced on later 1940 cars and this new interlock assembly should only be installed on early cars when trouble has actually occurred.

TYPE:—Same design as used on corresponding 1940 car models (Nash Transmission is new type but similar to other 'T84' models). Synchronizer design and gearshift mechanism on each model are as follows:

Synchronizer Assemblies:—Type used on each car as follows (no Synchronizer on Crosley—see description of Transmission below).

Double Blocker, Double Spring Type (Studebaker, Nash, Willys Models) — The two Synchronizer Rings are free in ends of inner clutch sleeve and are actuated by three shifting plates or struts which fit in slots in the inner clutch sleeve and engage notches in the synchronizer rings. Struts are centered in outer clutch sleeve by two wire springs (within struts on either side of inner clutch web) and move with the outer clutch sleeve to engage the synchronizer rings with the cones on the gear hub. The inner clutch sleeve is stationary on shaft does not move (retained with second speed gear by single snap ring at forward end of sleeve).

Wire Bound Strut Type Blocking Synchronizer (Graham)—Similar to double blocker type (above) except that struts are centered by single locking wire or ring in outer clutch sleeve which engages notches in center of each strut.

Poppet Ball Type (Bantam Model)—Both Inner and outer clutch sleeves centered by spring-loaded poppet balls. Synchronizer rings are fixed in ends of inner clutch sleeve (inner clutch moves with outer sleeve to engage rings, second speed gear mounted separately and retained by thrust washer and locking plunger at forward end of gear).

Gearshift Mechanism:—Consists of shifter shafts and lever assemblies mounted in side of transmission case, each lever operating entirely independently (rear lever for Low & Reverse, forward lever for Second & High) with forks on inner ends of shafts engaging the sliding gear (Low-Reverse) or synchronizer clutch sleeve (Second-High). Interlock and detent plungers are mounted in boss in case between shafts and engage notched sectors on each shifter shaft. NOTE—On T86D, separate detent plungers are located in holes in ends of case and are accessible after plugs which close these holes are taken out.

Graham Models—Shift lever (for gear engagement) and selector lever (cross-shift) are mounted in side cover on transmission case with conventional shifter plates or rails within the transmission case. **Bantam & Crosley Models**—Have conventional gear shift lever mounted on transmission case cover.

Crosley Transmission:—This transmission is a conventional sliding spur gear type. Forward gear on mainshaft is moved backward to engage Second, forward to engage High (clutch teeth on inner rim of gear engage clutch teeth on main drive gear). Rear gear on mainshaft engages low and reverse in same manner.

SERVICING: — Disassembly — Remove transmission cover, mark both synchronizer rings and inner and outer synchronizer clutch sleeves to insure reassembly in same positions. Drive out shift lever shaft lockpins (in holes in shaft bosses on outside of case) from below, pull levers out as far as possible to allow removal of mainshaft and gears. On Studebaker models, remove main drive gear bearing retainer (on front of case), remove large snap ring from bearing outer race and small snap ring from shaft, install pinion thrust yoke J-1525 (Champion), J-1526 (Comm. & President) to take up thrust and prevent damage to synchronizers, use puller plate J-1298 and puller HM-925 to remove main drive gear bearing from front of case. On other models, main drive gear and bearing can be removed as a unit after countershaft has been removed to drop countergear cluster and disengage drive gear from countergear. Remove nut on rear end of driveshaft, use puller to remove universal joint yoke (on models where separate front yoke used), remove speedometer pinion, take out rear bearing retainer (transmission extension) mounting screws and remove retainer, slide main shaft and rear bearing assembly to rear until bearing free of case. On Studebaker models (where main drive gear bearing previously removed), lift drive gear up so that it clears countergears, remove drive gear from front of case. On all models, push mainshaft assembly away from shifter shafts, remove second & high shifter fork, remove snap ring from forward end of mainshaft (in front of synchronizer unit inner clutch sleeve), slide synchronizer unit, second speed gear, and low speed gear off mainshaft and withdraw shaft from rear of case, lift synchronizer and gears out through top of case. To remove countergear assembly, remove lockplate from slot at rear end of countershaft, drive countershaft out toward rear using dummy shaft or arbor and leaving this arbor in countergear cluster to retain bearing rollers until asssembly re-installed in case (arbor will be driven out by countershaft as shaft installed). Lift out countergears and thrust washers noting locations of washers to insure correct reassembly.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Crosley Note—On this model, no rear bearing retainer is used and bearing is held in case by lock ring on each side of bearing outer race. To remove mainshaft and bearing, remove speedometer gear snap ring, speedometer gear and key, rear bearing snap rings, rear bearing and oil retainer washer, then pull mainshaft out through rear of case.

Reassembly:—Reverse disassembly directions above. When installing mainshaft, see that low & reverse gear properly engaged with shifter shoe when installing gear on shaft. When installing countergear cluster, install thrust washers at each end in same relative positions as removed and insert countershaft through rear end of case. Make certain that countershaft lockplate engages slots in both countershaft and reverse idler shaft before installing rear bearing retainer.

Transmission Extension Housing Bearing (Studebaker Commander & President) — Consists of a needle bearing and outer race assembly installed in housing. Use bearing remover tool J-1606 to remove old bearing and to install new bearing assembly.

Synchronizer Assembly (Double Blocker—Double Spring Type):—Install struts with open face toward inner clutch sleeve and hooked end of each spring wire engaged in the same strut (free end of spring will be between this strut and next strut in clockwise direction). See Second Speed Gear Assembly for installation instructions.

Wire Bound Strut Type—Install struts in inner sleeve and install lock wire so that it engages notches in struts with open end of wire midway between two struts (synchronizer will not operate if wire installed with open end at strut so that strut free to move endwise). When installing inner sleeve and strut assembly in outer sleeve, narrow strips of .003" feeler stock can be installed directly over each strut to prevent wire disengaging from strut slot when it is contracted to enter outer sleeve. CAUTION—Make certain that open end of wire is engaged between two clutch teeth in outer sleeve and remove feeler strips before assembling synchronizer on mainshaft. See Second Speed Gear Assembly below for installation instructions.

Poppet Ball Type—Synchronizer is free on shaft and can be removed as an assembly. If outer clutch sleeve removed use extreme care not to lose poppet balls and springs (will fly out when sleeve removed).

Second Speed Gear Assembly (With Double Blocker—Double Spring & Wire Bound Strut Type Synchronizers):—Gear and inner sleeve or hub of synchronizer are mounted on mainshaft as an assembly and retained by a snap ring at the forward end of the synchronizer. To disassemble, remove snap ring, withdraw synchronizer assembly and gear. When reassembling make certain that second speed gear has .004-.008" endplay with synchronizer hub pressed forward against snap ring (endplay adjusted by installing snap ring of correct thickness). See that synchronizer ring turns freely after assembly (with gears not engaged).

Gearshift Mechanism:—Shifter shafts can be withdrawn through case after nut on outer end of lever has been removed and lever taken off. When reassembling shafts, see that interlock and detent plungers and springs are properly installed and engage notches in sectors on shifter shafts, install oil seal in recess in case at outer end of shafts. Coat shaft lock pins with Permatex or shellac, drive pins in so that they are 1/8-3/16" past flush.

WARNER MODELS WITH OVERDRIVE

Used On:

GRAHAM HOLLYWOOD, 109, 113 (1941)
WILLYS AMERICAR & PLAINSMAN 441 (1941)

Model AS4-T84G
NASH '600', MODEL 4140 (1941)

Model AS2-T84G
STUDEBAKER CHAMPION, MODEL 3G (1941)

Model AS2-T86D
STUDEBAKER COMMANDER, MODEL 11A (1941)
STUDEBAKER PRESIDENT, MODEL 7C (1941)

TRANSMISSION CONTROL NOTE:—These models have 'kick-down' type electrical control. See Warner Overdrive Control article (following) for complete adjustment data and specifications for Solenoid, Relay, and Throttle Switch adjustment.

Steering Column Gearshift—See separate Transmission Control articles for adjustment directions on gearshift on each car model.

TYPE:—These Overdrive Transmissions consist of a conventional transmission with an additional Overdrive unit. Transmission is modified for overdrive mounting by the use of an extended mainshaft which projects into the overdrive case and serves as a mounting for the sun gear, pinion gears and centrifugal clutch pawl assembly, and freewheel cam and roller assembly. Transmission and Overdrive units can be serviced separately as directed below.

SERVICING:—**Transmission**—Disassembled and serviced in same manner as standard transmissions without overdrive. See preceding Warner Transmission article for complete data.

Overdrive:—See Warner Overdrive article (following) for complete servicing data. See Warner 'Kick-down' Overdrive Control article for all adjustment and servicing data on the 'kick-down' operating solenoid, relay, and throttle switch used on each car model.

WARNER OVERDRIVE

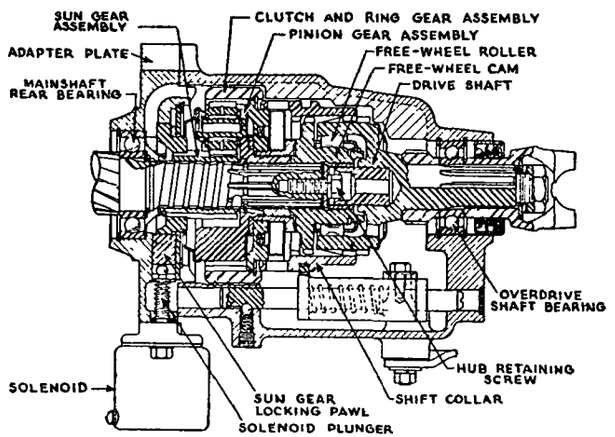
Used On:

GRAHAM HOLLYWOOD, 109, 113 (1941)
WILLYS AMERICAR & PLAINSMAN 441 (1941)

Type R7C
NASH '600', MODEL 4140 (1941)
STUDEBAKER CHAMPION, MODEL 3G (1941)
STUDEBAKER COMMANDER, MODEL 11A (1941)
STUDEBAKER PRESIDENT, MODEL 7C (1941)

Model AS1-R7B
CHRYSLER, MODELS C30,C33 (1941)—SEE NOTE

Model AS1-R7C
NASH AMBASSADOR 6, 4160 (1941)
NASH AMBASSADOR 8, 4180 (1941)



NOTE:—These Overdrive units are used in conjunction with Warner Transmissions (see preceding article on Warner Overdrive Transmissions) or with transmissions built by the car manufacturers (Chrysler, Nash 4160, 4180 only). See separate articles for Transmission servicing data.

Chrysler—This Overdrive unit is assembled as part of the 'Vacamatic Overdrive Transmission' which is Std. Equipment on these models. See separate article on 'Chrysler Vacamatic Overdrive Transmission' for transmission servicing data.

Hudson, Lincoln, Packard Models—Overdrive on these models is special electrical type (no centrifugal clutch pawls) and is serviced differently. See separate article on Warner Electrical Type Overdrive for data.

TYPE:—Same design as used on 1940 car models with sun gear normally locked in position by solenoid controlled pawl and overdrive engagement controlled by clutch pawls. When accelerator pedal depressed fully to operate 'kick-down' feature, solenoid is energized and withdraws pawl from sun gear, allowing gear to rotate freely, resulting in a direct drive from the engine to the rear wheels.

SERVICING:—**Chrysler Note**—Adapter plate and overdrive case are held together by three special screws inserted in holes in front face of adapter plate. Overdrive assembly must be removed from the transmission as a unit with the adapter plate and mainshaft assembly. Special tool C-577 must then be used to take out screws in adapter plate before overdrive can be disassembled.

Nash 4140 Note—No universal joint companion flange used and rear bearing retained by snap ring on shaft at rear of bearing. This snap ring must be removed first in order to remove overdrive case without disturbing shaft and free-wheeling roller assembly (shaft will come out with case otherwise which will allow rollers to drop out).

Studebaker Note—No universal joint companion flange used and rear bearing retained by oil seal and retainer housing bolted on rear end of overdrive case and snap ring on shaft at rear of bearing. When removing overdrive case, first remove retainer and take out snap ring (use special pliers No. 187) so that case can be withdrawn without disturbing shaft and free-wheel roller assembly.

Disassembly:—See special notes above. Remove speedometer drive pinion assembly, take off retainer screw and washer on rear end of shaft and use puller to remove universal joint companion flange (not used on all models—see notes above). Remove screws and nuts holding overdrive case and adapter plate to transmission case. Press forward on rear end of driveshaft and pull overdrive case off to rear, using extreme care not to allow adapter plate to separate from transmission case (if transmission not to be disassembled). Clutch collar will remain

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

in overdrive case but overdrive assembly will not be disturbed otherwise. Then disassemble sub-assemblies as follows:

Overdrive—Pull driveshaft off at rear, catching rollers as they drop out of free-wheeling assembly. Remove capscrew and washers on end of main-shaft, remove hub bushing and free-wheel cam from shaft. Remove ring gear and clutch pawl assembly, thrust washer, and pinion assembly (pinions are split type and must be properly wound up when re-installed). Take out sun gear thrust plate retaining snap ring in adapter plate, remove thrust plate. Take out two mounting screws and remove kick-down solenoid. Remove solenoid plunger assembly and pawl, disengaging pawl from end of plunger and being careful not to lose mounting gaskets or shims under plunger flange (these shims control pawl clearance). Remove pinion cage stop ring from shaft directly to rear of sun gear, withdraw sun gear and hub assembly.

Overdrive Shift Mechanism—On all models except Chrysler, new Limiting Screw installed in side of case to limit travel of overdrive shift shaft and fork (replaces spring-loaded ball type detent). To disassemble shift control, remove lockwire and withdraw reverse lock-out pin through front of case, rotate shift fork and disengage shift collar, remove shift collar. To remove shift shaft and fork assembly, take out limiting screw on side of case, remove setscrew in fork (work through hole in case after removing plug from this hole), withdraw shaft, lift fork out. To remove shift lever and shaft, take off nut on outer end of shaft, remove lever, loosen setscrew in case, withdraw shaft from within case. Reassemble shift mechanism in same order.

Sun Gear & Hub Assembly:—To dismantle assembly, take out snap ring in hub at forward end of gear, withdraw gear from hub. Check balk ring friction on sun gear hub. Pull required to turn balk ring in clockwise direction on hub should be 8-10 lbs. (if friction less than this amount, balk ring will not block pawl out for 'kick-down' direct drive). When reassembling sun gear and hub,see that oil slots in gear and hub are lined up.

Sun Gear Pawl & Balk Ring Clearance—Clearance between end of pawl and face of lug on balk ring should be .015" with balk ring rotated to block out pawl. If solenoid assembled, clearance can be checked by energizing solenoid so that pawl is withdrawn. Adjust by adding or removing solenoid gaskets.

Pinion Cage Assembly:—To remove pinion assembly, pull pinions out of ring gear. Assembly cannot be dismantled (oil slinger which is spun on pinion cage retains pinion shaft pins). When remeshing split type pinions in ring gear, wind up narrow half of each split pinion 1½ teeth so that marked teeth on wide and narrow halves of pinion are together, mesh ring gear with pinions held in this position. When installing pinion gears, mesh wide half of each split pinion with sun gear, then install ring gear so that it meshes with narrow half of each pinion only, revolve sun gear counter-clockwise (transmission mainshaft must be held from turning which may be accomplished by shifting transmission into two gears at once) until pinions are wound up approximately 1½ turns and marked pinion teeth are together, then push ring gear into place so that pinions fully meshed with ring gear and sun gear.

Ring Gear & Clutch Pawl Assembly:—Take out snap ring in inner rim of ring gear, clutch pawl and core assembly from ring gear. Clutch pawl adjusting screws, washers, and springs can be removed but no further disassembly is possible (clutch core must be concentric with gear teeth and cannot be reamed sufficiently accurately in the field, parts are not furnished separately). CAUTION—If adjusting screws removed, count number of notches or 'clicks' as each screw is turned out so that screws can be replaced in exactly same position. These screws control cut-in speed (see adjustment directions below).

Clutch Pawl & Pinion Cage Thrust Washer—Bronze thrust washer between clutch pawl hub and pinion cage should be installed with projection on washer engaging notch on hub (washer can be retained with cup grease while assembling parts). Clutch core assembly endplay should be .005-.010" with all parts installed on mainshaft and retaining screw tight.

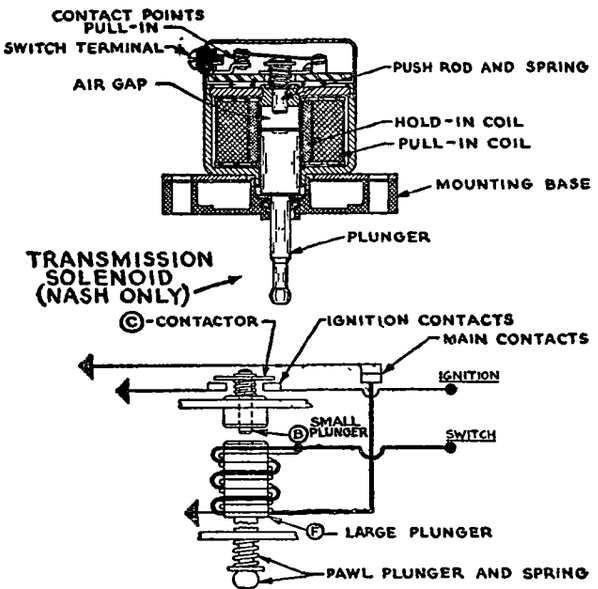
Overdrive Solenoid & Plunger Assembly:—See following article on Warner Overdrive Control for complete solenoid data.

Reassembly:—Use new snap rings if old rings distorted or damaged by removal, reverse disassembly directions given above and note following points: Make certain that snap ring installed on main shaft in back of sun gear assembly (this snap ring controls pinion cage endplay), see that split type pinions are correctly wound up when meshed with ring gear, pack free-wheel rollers with cup grease or use rubber band to retain rollers, start drive shaft over free-wheel rollers and cam (turn rollers and cage counter-clockwise so that rollers on low points of cam), remove rubber band and push drive shaft forward into place. See that rear bearing and oil seal properly installed in overdrive case and that bearing snap rings are in place on both sides of bearing. Install shift collar in case, then install case and collar assembly on shaft assembly, guiding collar by reaching through drain plug hole in case so that it engages teeth on free-wheel cam and clutch pawl assembly, and guiding lock-out reverse pin through hole in adapter plate. Adjust overdrive control when transmission re-installed on car.

ADJUSTMENT:—**Cut-in Speed.** Should not be changed from original standard setting. If clutch pawl adjusting screws removed, make certain that both screws turned in same number of 'clicks' as original setting and screws adjusted alike. Screws must not be turned so far in or out as to cause interference. With standard setting, cut-in speed for each model is as follows:

Car Model	Cut-in Speed
Chrysler C30,C33	25 MPH.
Nash (all)	33 MPH.
Studebaker (all)	32-36 MPH.
Willys	32 MPH.

CAUTION—Both adjusting screws must be adjusted exactly alike. One screw marked by single slot, opposite screw marked by double slot for identification. Use care not to adjust same screw twice.



Overdrive Lock-out Control Adjustment:—To adjust lock-out control button cable, loosen clampscrew on lever on overdrive case, move control button on dash to fully 'in' position, then pull button out ⅛", make certain that overdrive case lever moved to rear as far as possible, tighten control wire clampscrew and locknut.

WARNER OVERDRIVE CONTROL 'KICK-DOWN' TYPE

On Following Cars:
CHRYSLER, MODELS C30,C33 (1941)
GRAHAM HOLLYWOOD, 109, 113 (1941)
NASH '600', MODEL 4140 (1941)
NASH SIX 4160, EIGHT 4180 (1941)
STUDEBAKER CHAMPION, MODEL 3G (1941)
STUDEBAKER COMMANDER, MODEL 11A (1941)
STUDEBAKER PRESIDENT, MODEL 7C (1941)
WILLYS AMERICAR & PLAINSMAN, 441 (1941)

NOTE:—This electrical 'kick-down' control is used to control the kick-down or return to direct drive on cars using Warner Overdrives. See preceding article for Overdrive servicing data.

Hudson, Lincoln, Packard Models—Overdrive control is different design. See separate article (following 'Warner Electric Type Overdrive') for adjustment directions on these models.

TRANSMISSION SOLENOID (ALL OTHERS)

TYPE:—Same as for 1940 car models with 'kick-down' feature. Two different types of control solenoids used as follows:

Nash Models—Plain type solenoid (no ignition control contacts) used in conjunction with special two unit relay. Ignition feed wire (from ammeter to ignition switch) is taken through contacts of series relay unit so that ignition is cut out by momentary opening of contacts while the kick-down to direct drive is being effected. The relay also contains a shunt relay unit which operates in the usual manner to control the transmission solenoid.

Other Models—Operate in same manner as in 1940 (small plunger in transmission solenoid closes ignition contacts and shorts out ignition, large plunger then withdraws pawl and opens ignition contacts so that ignition is restored).

CAR WIRING CIRCUITS:—See wiring diagram on car model 'T&E' page for complete transmission control wiring diagrams.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ADJUSTMENT:—Check and adjust throttle switch linkage on each car model as directed below whenever linkage is disconnected or disturbed by carburetor adjustment, removal of units, etc.

Chrysler Models C30, C33—Gap between switch plunger contact screw and plunger should be 3/32" with throttle valve wide open. To adjust, remove air cleaner (to observe throttle valve), open throttle until throttle valve is just wide open, loosen locknut and turn contact screw until gap is 3/32", tighten locknut.

Graham Models—Adjust position of operating block (on connecting rod linkage ballcrank and throttle valve lever) so that throttle switch plunger is depressed not more than 1/32" with throttle in wide open position. See that linkage over-travel is sufficient to close switch contacts before accelerator pedal bottoms on toeboard.

Nash Models—Throttle switch is mounted on dash and is cable operated. To adjust, loosen locknut and adjust switch position on mounting bracket so that contacts close when throttle is wide open and spring on carburetor throttle shaft pulley just begins to compress. Check accelerator pedal over-travel and adjust stopscrew on floor board so that pedal has sufficient travel beyond wide open throttle position to operate switch.

Studebaker Models—Depress accelerator pedal until throttle valve is just wide open and throttle lever contacts wide-open throttle stop. Hold linkage in this position, loosen locknut on switch mounting stud, turn switch in or out of mounting bracket until contact shoe on idler lever just contacts switch plunger, tighten locknut.

Willys—Adjust position of switch on mounting bracket so that contact shoe on end of accelerator rod just contacts switch plunger (maximum clearance 1/32") with carburetor throttle wide open. See that linkage has sufficient over-travel to close switch contacts.

SERVICING OVERDRIVE SOLENOID:—Removal—To remove solenoid (for transmission and overdrive removal or for servicing), take out two capscrews in mounting flange, withdraw solenoid case without disturbing base plate and plunger assembly.

CAUTION—Do not lose gaskets under solenoid assembly. These gaskets control pawl mesh and must be replaced when solenoid installed.

Servicing—No servicing required other than to keep contacts clean and parallel so as to make good electrical contact. To remove cover for contact inspection, disconnect wires, take out flat headed screw, pull cover off base. See that lower face of contact disc on plunger 'B' and contact plates (which short out ignition) are clean and smooth. Resurface main contacts (which control 'starting coil' circuit with a file, if necessary, to secure smooth parallel contact surfaces. Check contact gaps and solenoid performance (see specifications below).

FUSES:—Fuses located on Solenoid Relay to protect solenoid circuits. If solenoid does not withdraw sun gear pawl for any reason, fuse will blow so that ignition is restored and car can be driven normally except that kick-down feature will not operate.

CAUTION—Do not use fuse of any other capacity than that shown in table below (no fuse used on Graham and Nash models).

Car Model	Fuse Capacity
Chrysler	20 amperes
Studebaker	14 amperes
Willys	20 amperes

SPECIFICATIONS:—Control System units for each car model are of various makes as follows:

Car Model	Solenoid Relay	Solenoid
Chrysler	A-L. HR-4201	A-L. SSB-4001
Graham	R-B-M No. 4740	D-R. No. 1569
Nash	D-R. 1116798	D-R. 1118004
Studebaker	AL. HR-4201	D-R. 1118013
Willys	AL. HR-4201AS	D-R. No. 1569

AUTO-LITE SOLENOIDS

Small Plunger 'B'—Should close with 2.5 volts min., 4 volts max. (6 volt units), 5 volts min., 8 volts max. (12 volt units) with large plunger 'F' 3/8" from bottom.

Large Plunger 'F'—Should exert pull of 21 lbs. min. (70° F.), 15 lbs. min. (210° F.) when 3/8" from bottomed position.

Contact Gap (main contacts)—.047" plus or minus .015" with large plunger 'F' bottomed in coil.

Current Draw (At 70° F.)—'Both coils' figure is for both Holding and Starting coils together (main contacts closed). 'Holding Coil' figure is for Holding coil only (main contacts open—plunger bottomed in coil).

Six Volt Units

	Min.	Amperes	Max.	Volts
Both Coils	29.0		31.0	3
Holding Coil	1.2		1.3	6

Twelve Volt Units

Both Coils	14		15	6
Holding Coil	.55		.65	12

AUTO-LITE RELAYS

Contact Gap—.026". Air Gap—.012-.017" (closed).

Closing Voltage—2.5-3.5 volts (6 volt units), 5.0-7.0 volts (12 volt units).

Current Draw—Measure between 'TH.SW' and 'IGN. SW.' terminals. Current should be 1.07-1.15 amperes at 6.0 volts (6 volt units—winding resistance 5.2-5.6 ohms), .89-.93 amperes at 12.0 volts (12 volt units—winding resistance 12.9-13.5 ohms).

R-B-M RELAYS

Contacts Close—3.5-4.5 volts.

Current Draw—Approximately 3/4 ampere.

DELCO-REMY SOLENOIDS
No. 1569 (6 volt), 1573 (12 volt)
1118001, 1118013 (6 volt).

Small Plunger 'B'—Should close at 5.0 volts (6 volt units), 6-10 volts (12 volt units) with 3/8" gap of large plunger.

Large Plunger 'F'—Should close against 16 lbs. pull with 3/8" plunger air gap at 6.3 volts max. (6 volt units), 12.6 volts max. (12 volt units) with both coils operating.

Contact Gap (Main Contacts)—.020-.060" with large plunger 'F' bottomed in coil.

Contact Spring Tension—10-13 ounces.

Current Darw—'Both Coils' figure is for both coils together (main contacts closed), 'Holding Coil' figure is for holding coil only (main contacts open and plunger bottomed in coil).

Six Volt Units

	Amperes	Volts
Both Coils	28-34	6.0
Holding Coil	.9-1.1	6.0

Twelve Volt Units

Both Coils	24.5-27.5	12.0
Holding Coil	.6-.72	12.0

Model No. 1118004 (Nash)

NOTE—This solenoid does not have small plunger and ignition contacts. Both windings are connected to the single solenoid terminal (starting coil circuit is opened by the opening of the main contacts as the plunger bottoms in the coil, holding coil only then holds plunger in coil).

Solenoid Plunger—Should close against 16 lbs. pull with 3/8" plunger air gap at 6.3 volts maximum.

Current Draw—28-34 amperes at 6.0 volts (Both coils—main contacts closed), .9-1.1 amperes at 6.0 volts (Holding coil only—main contacts open).

DELCO-REMY RELAYS
Model No. 1116798 (Nash)

NOTE—This unit consists of two separate relays which operate as follows: **Series Relay**—Winding connected in series with shunt relay contacts. All current for solenoid goes through this winding. When armature attracted to core, contacts open and break ignition circuit (all ignition current goes through this series relay contacts). Current draw of solenoid holding coil is not sufficient to hold armature down and closing of contacts restores ignition as soon as transmission solenoid operates (which cuts out solenoid starting coil and causes solenoid current to drop from approximately 30 amperes to 1 ampere—see solenoid specifications above). **Shunt Relay**—Winding is connected in throttle switch circuit and contacts control current flow to transmission solenoid (closing of contacts when armature attracted to core completes solenoid circuit, contacts remain closed until throttle switch contacts are opened).

Series Relay Specifications.

Contacts Open (Armature attracted to core)—13.0-16.0 amperes.

Contacts Close (Armature Released)—6.0 amperes min.

Contact Gap—.030".

Shunt Relay Specifications.

Contacts Close (Armature attracted to core)—3.0-4.0 volts.

Contact Gap—.025".

Air Gap—.012" (with contacts closed).

WARNER ELECTRIC TYPE OVERDRIVE

PACKARD '120' EIGHT, 1901, 1A (1941)
PACKARD CLIPPER, MODEL 1951 (1941)

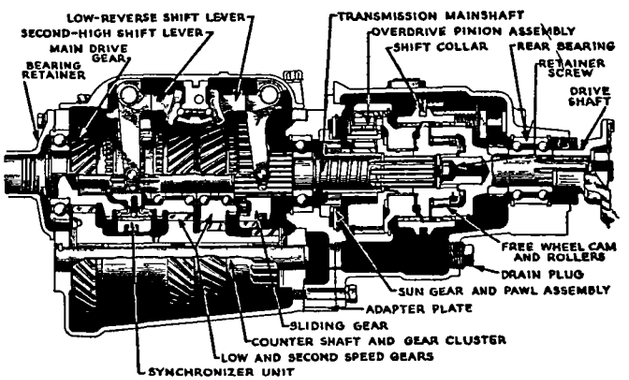
Model AS1-R9A
PACKARD SUPER 8, 1903,3A,4,5,6,7,8 (1941)

NOTE:—These overdrives used in conjunction with transmissions manufactured by each of these car manufacturers. Refer to separate transmission articles for transmission servicing data.

TYPE:—Simplified overdrive unit without centrifugal clutch pawls. Ring gear mounting plate is linked directly to final drive shaft by shift collar (shift collar also engages free-wheel cam when overdrive locked out) so that engine drives rear wheels through overdrive pinion gears (when overdrive operative) or through free-wheel mechanism (for direct drive below overdrive cut-in speed and also for the 'kick-down' direct drive—drive is exactly the same in both instances).

OPERATION:—Overdrive cut-in and cut-out is controlled electrically by a solenoid which operates in exactly opposite manner from the kick-down solenoids used on models with centrifugal clutch pawls (solenoid plunger pushes pawl in to engage sun

CONTINUED ON NEXT PAGE



CONTINUED FROM PRECEDING PAGE

gear for overdrive, pulls pawl out to disengage sun gear for both direct drive below cut-in speed and for kick-down direct drive). Pawl is pushed in electrically and is pulled out by a spring within the solenoid case. *See Transmission Control article (following) for solenoid description and servicing data.*

SERVICING:—Except for omission of entire centrifugal clutch pawl assembly, these overdrives serviced in same manner as other Warner models. *Refer to preceding Warner Overdrive article for complete instructions and note following additional data:*

Driveshaft Rear Bearing (All Packard)—Bearing is new type double-row ball bearing which is pre-loaded in assembly so that no pre-load adjustment or special installation directions required. Bearing is retained in overdrive case by snap ring at each end of bearing outer race.

Sun Gear Pawl Interlock Plunger (Hudson)—Consists of two plungers and an intermediate lever installed in the adapter plate flange so that one plunger engages the shifter rail and forces the other plunger into engagement with the sun gear pawl with the overdrive locked out which prevents the pawl operating. Long plunger (shift rail plunger) furnished in five different lengths. Install plunger of correct length so that clearance between lower end of plunger and tip of interlock intermediate lever is .008-.021" with long plunger in shift rail groove and top of short plunger against sun gear pawl. CAUTION—See special assembling directions below to insure correct operation of this interlock.

Sun Gear Pawl Interlock Plunger (Packard 6 & 8)—Same design as Hudson (above) with two plungers and intermediate lever. Long plunger is furnished in three different sizes for clearance adjustment.

Sun Gear Pawl Interlock Plunger (Super Eight)—plunger installed in hole in overdrive case engages notch in side of sun gear pawl when the control button is operated to lock-out the overdrive. Plunger prevents pawl engaging sun gear. Clearance between end of interlock plunger and side of pawl should be .010" in overdrive position (pawl engaged in sun gear mounting plate slot).

Governor Switch—Switch is mounted on rear end of overdrive case and is driven by the speedometer drive gear. Remove governor switch assembly before dismantling overdrive.

ADJUSTMENT:—Lockout Control Button Linkage—Button should clear bracket by ⅛" when pushed in to insure full travel of control travel on overdrive case. To adjust, loosen control cable at binding screw on lever on left side of overdrive case, push control button in as far as possible, then pull button out ⅛". Move control lever on overdrive case to rear as far as possible, then move lever forward until a resistance is just felt and tighten control cable binding screw.

Cut In Speed—22 MPH. NOTE—Cut-in speed not adjustable except by installing special Governor Switch springs.

OVERDRIVE INSTALLATION:—Hudson Models—When installing overdrive case, use Overdrive Aligning Pilot J-1579 to align case so that interlock lever and plungers will have clearance for correct operation. Install pilot in lower hole of overdrive case so that it engages hole in adapter plate and transmission. Leave pilot in place until the other four mounting bolts have been installed and tightened, then remove pilot and install last mounting bolt.

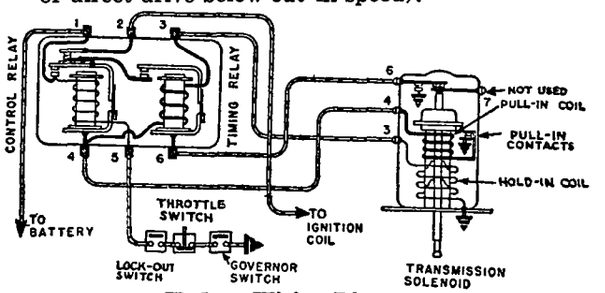
WARNER ELECTRICAL OVERDRIVE CONTROL

On Following Cars:

HUDSON, MODELS 10,11,12,14,15,17,18 (1941)
PACKARD CLIPPER, MODEL 1951 (1941)
PACKARD, SIX 1900, EIGHT 1901,1A (1941)
PACKARD SUPER 8, 1903,3A,4,5,6,7,8 (1941)

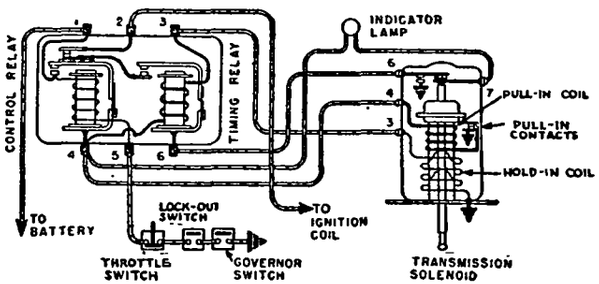
SPECIAL SERVICE NOTES & PRODUCTION CHANGES:—Hudson Governor Switch—Governor switch changed in production and new type with reversed oil groove in shaft bushings to prevent oil working up into switch body used on later cars. This new Governor Switch, Part No. 162867, used on later cars and may be identified by purple dots on terminal screw heads and purple band around switch body. Install this new switch on early cars to correct complaints of overdrive cutting in late (25-30 MPH.) or not operating.

Packard Governor Switch—On cars with Electromatic Clutch Control, same Governor switch used for both clutch and overdrive control (switch has two terminals and duplicate sets of contacts). Overdrive control should be connected to 'AD' terminal on switch ('EC' terminal is for clutch control).



DESCRIPTION:—Special design, electrical control with 'kick-down' direct drive feature. New type Transmission Solenoid is 'push type' and pushes pawl in to engage sun gear mounting plate slot (to hold sun gear stationary for overdrive) when solenoid is energized. Spring in solenoid case pulls pawl out to disengage sun gear (for direct drive) when solenoid circuit is broken. Both solenoid windings (Pull-in Coil and Hold-in Coil) are energized to engage pawl for overdrive, Hold-in coil only is energized during entire period in which car is in overdrive. Solenoid is controlled by a Lock-out Switch (operated in conjunction with the lock-out control knob on the instrument panel), Governor Switch, Throttle kick-down Switch, and two unit relay (Control Relay and Timing Relay) as follows:

Lock-out Switch—Connected in series with kick-down switch and governor switch. Contacts are closed with control knob pushed in (for overdrive) and are opened when control knob pulled out (to lock-out overdrive).



Governor Switch—Centrifugal type switch mounted on rear of overdrive case and driven by speedometer drive gear. Acts as the main switch to engage overdrive (switch contacts close at cut-in speed of 22 M.P.H. and remain closed until speed drops below 17 M.P.H.). Governor switch is not adjustable and cut-in speed can be changed only by installing special switch springs (see Adjustment data below).

Throttle Kick-down Switch—Switch contacts are normally closed (throttle wide open or less) and are opened when the accelerator pedal is fully depressed to operate the kick-down for direct drive.

Control & Timing Relay—Consists of two units, a double contact (upper and lower contacts) Control Relay which controls the transmission solenoid circuit, and a single contact Timing Relay which controls the ignition 'cut-out' which permits the sun gear pawl to be withdrawn from the sun gear for return to direct drive (kick-down direct drive, or direct drive below cut-in speed).

Hudson Wiring Diagram

Packard Wiring Diagram

OPERATION:—Overdrive Engagement—Throttle switch and lock-out switch contacts are normally closed (control knob pushed in). At cut-in speed of 22 M.P.H., governor switch contacts close which completes circuit for Control Relay winding. Control relay upper contacts open and lower contacts close which completes circuit for both pull-in and hold-in coils in transmission solenoid. This causes the solenoid plunger to bottom in the coil, compressing the pawl spring, and causing the pawl to be pushed into engagement with the sun gear mounting plate slot so that the overdrive is operative (spring engages pawl as soon as accelerator pedal released momentarily). On Packard, dash indicator light controlled by solenoid upper contacts lights to indicate that overdrive should be engaged, light goes out as soon as overdrive is engaged). The bottoming of the solenoid plunger in the coil opens the pull-in coil contacts in the solenoid (lower contacts) and cuts this pull-in coil out of action. The hold-in coil remains energized during the entire time the overdrive is engaged and holds the solenoid plunger bottomed in the coil.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Overdrive Disengagement—When the overdrive engages, the timing relay contacts close (this relay winding is connected in series with the solenoid hold-in coil) and the solenoid upper contacts also close, but the ignition is not cut out because the control relay upper contacts have already opened (all three sets of contacts are connected in series in the ignition cut-out or ground circuit). When the throttle switch contacts are open (when accelerator pedal depressed fully for kick-down direct drive) or governor switch contacts open (for return to direct drive at speeds below 17 M.P.H.), the control relay upper contacts close first and, since the other two sets of contacts are also closed, the ignition is shorted or cut out momentarily to allow the solenoid spring to disengage the pawl from the sun gear for direct drive. The timing relay winding circuit is opened by the opening of the control relay contacts (which occurs before the control relay upper contacts close) but the 'time delay' feature of this timing relay causes a very short interval to elapse before the timing relay contacts open. As soon as these contacts open, or when the solenoid upper contacts open (which occurs as soon as the spring pulls the pawl out of engagement), the ignition ground circuit is broken and ignition is restored (both sets of contacts protect the ignition circuit when the overdrive is not operating).

ADJUSTMENT: — Hudson Throttle Switch — Adjust whenever carburetor linkage adjusted or disconnected. To check setting, remove carburetor air cleaner to observe throttle valve, depress accelerator so that throttle valve just wide open, loosen nuts on accelerator pedal rod and adjust position of contact washer on rod so that it is just contacting throttle switch plunger, tighten both nuts to retain contact washer in this position.

Packard Throttle Switch—Should be adjusted whenever carburetor linkage adjusted or disconnected. To check setting, remove air cleaner (to observe throttle valve), open throttle until valve is just wide open. If tappet screw on accelerator link lever does not contact throttle switch plunger at this point, adjust by loosening locknut and turning screw in or out of lever.

Governor Switch—Governor switch is not adjustable and no attempt should be made to change cut-in speed by stretching spring or shimming cover. *NOTE*—See *Special Service Notes* above for production changes and special Governor Switch data.

Governor Switch

Car Model	Part No.
Hudson (All Models)	Hudson No. 162867
Packard (All Models)	Packard No. 364782

FUSE:—Packard. 30 ampere. Located in fuse container in the line between the starting switch and the Solenoid Relay '1' terminal. Do not use fuse of any other capacity at this point.

SERVICING:—Overdrive Relay—This relay consists of two units which should be checked and adjusted differently as follows:

Control Relay

Air Gap—.012" (lower contacts closed), .032" (lower contacts open). Check first with armature held down so lower contacts closed, adjust by loosening two screws on hinge bracket on back of relay and raising or lowering armature, see that gap uniform across whole surface of core. Then check air gap with armature released (upper contacts closed), adjust by bending upper contact support—do not loosen hinge bracket screws.

Contact Gap—.022" (top contacts) with lower contacts held closed. Should be correct if air gaps correct (above) and contact spring not bent.

Closing Voltage—3.4-4.0 (6 volt units), 6.8-8.0 volts (12 volt units). CAUTION—This voltage will attract armature and close lower contacts (upper contacts open as lower contacts close). To check closing, connect battery and variable rheostat to relay terminals #1 and 5, increase voltage and note when contacts close. To adjust, bend spring hanger at upper and lower end of spiral armature spring.

Timing Relay

Air Gap—.031" with contacts open. Adjust by bending upper armature stop—**do not disturb armature hinge bracket mounting screws.**

Contact Gap—.022". Adjust by bending lower contact support.

Closing Voltage—.6-1.1 volt (6 volt units), 1.2-2.2 volts (12 volt units). To check closing, connect battery and variable rheostat to terminals #3 and 4, increase voltage and note when contacts close.

'Time Delay' Action—.1-.2 seconds (between instant current flow through winding is stopped and opening of contacts). To check timing action on car, operate engine at medium speed, close **control relay** lower contacts by hand (timing relay contacts will close), release control relay contacts and note interval before timing relay contacts open (lag should be noticeable). Adjust by bending spring hangers on upper and lower end of spiral armature spring (increase spring tension to shorten time interval).

Transmission Solenoid:—Solenoid cover can be removed, for inspection and servicing, by taking off two nuts on studs on cover. CAUTION—Pawl rod must not be forced into solenoid with cover removed—this will damage contact plate flat springs.

Solenoid Operation Test—Plunger actuating voltage should be 4.9 volts (6 volt units), 6.8 volts (12 volt units) max. at room temperature. To check performance, block pawl rod so that it cannot move out of solenoid when plunger is actuated, remove solenoid cover, connect voltmeter, battery, and variable rheostat between terminals #3 and 4 (connect these terminals together) and ground on solenoid case. Increase voltage and note voltage reading at point where plunger is actuated.

Pull-in Coil Contact Gap—With solenoid bottomed in coil, pull-in coil contact gap should be .018-.040". Remove solenoid cover to check these contacts. See Pawl Rod Adjustment below.

Solenoid Current Draw—To check current connect battery and ammeter between #4 terminal and ground on solenoid case (Pull-in Coil), or #3 terminal and case (Hold-in Coil). This check must be made at specified voltage. 'Both Coil' figure below is for both Pull-in and Hold-in Coil together, 'Hold-in Coil' figure is for Hold-in coil only.

6 Volt Units

Both Coils	31.0-36.0 amperes at 6.0 volts.
Hold-in Coil	1.4-1.6 amperes at 6.0 volts.

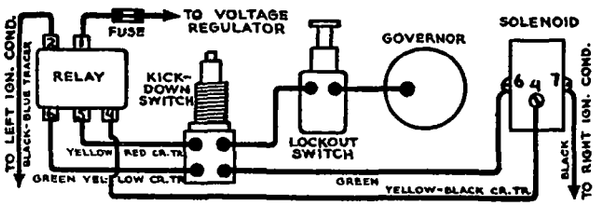
12 Volt Units

Both Coils	14.0-16.0 amperes at 12.0 volts.
Hold-in Coil	1.0-1.2 amperes at 12.0 volts.

Pawl Rod Adjustment—With pawl rod assembly removed from solenoid, check length from lower face of adjusting nut on upper end of pawl rod to lower edge of plunger. This distance should be 2.022-2.037". To adjust, press down on locking spring below adjusting nut so that prong on spring clears notch in nut, turn nut on plunger. CAUTION—Use care not to distort locking spring and see that prong on spring engages notch in nut after adjustment completed.

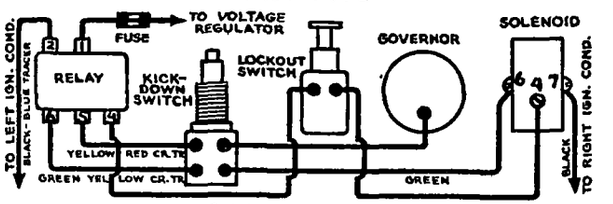
WARNER (LINCOLN) OVERDRIVE

Model AS1-R10



LINCOLN, ZEPHYR & CONTINENTAL 16H (1941)
LINCOLN, CUSTOM MODEL 168H (1941)

NOTE:—This Overdrive used in conjunction with a Lincoln Transmission. See separate article for transmission data.



SPECIAL SERVICE NOTES AND PRODUCTION CHANGES:—Recommended Relay Mounting Change on First Cars—On first cars with relay mounted on engine dash with terminals 4, 5, 6 upward, it is advised that relay be dismounted and reversed with terminals 1, 2 upward. Any foreign material lodged on terminals should be carefully cleaned off. Grounding of terminal #5 will prevent overdrive releasing and may damage transmission if attempt made to reverse car.

Throttle Kick-down Switch Caution—If floor tunnel screws removed, use extreme care to install special short screw in hole immediately ahead of kick-down switch. If regular length screw installed in this hole, screw may contact upper switch terminals and cause ground in circuit at this point.

Control Wiring Change—Control circuit wiring changed after approximately first 500 cars. See illustration for first and later type wiring diagrams.

FIRST TYPE

SECOND TYPE

TYPE:—Warner Type R10 (all models). New design overdrive unit with solenoid control (no centrifugal clutch pawls). Design similar to type used on Packard (see data above) except for control circuits and lockout mechanism which are entirely new design as described below. Solenoid pushes sun gear pawl in (to engage Overdrive), withdraws pawl (for Direct Drive). Solenoid is controlled by Governor Switch (Overdrive does not engage above cut-in speed until accelerator pedal released momentarily) and has 'kick-down' direct drive feature.

Lockout Mechanism—Consists of a shift collar positioned on the sun gear by snap rings so that the sun gear can be shifted to the rear to engage clutch teeth in a lock plate mounted on the planetary pinion assembly so that the planetary gears are locked together for direct drive. CAUTION—This lockout action can only take place with overdrive in direct drive (sun gear and lockplate turning at same speed) and overdrive must be 'kicked-down' to direct drive to operate the control as described below.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Control Mechanism—Overdrive operating solenoid is controlled by a Control Relay mounted on the dash, a Governor Switch mounted on the overdrive case extension and driven from the driveshaft, a Lockout Switch mounted on the overdrive case and operated by the lockout shift rail which is linked to the lockout control button on the instrument panel, and a Kickdown Switch operated by the accelerator pedal. See wiring diagram for wiring circuits for these units. NOTE—Since ignition system for each bank of cylinders is independent, two separate ignition cut-out circuits (for momentary cutting out of ignition to permit kick-down direct drive to be engaged) are required and these ignition connections are shown in the diagram.

OPERATION & ADJUSTMENT:—Lockout Control—If dash control button is to be pulled out (to lockout overdrive), accelerator pedal should first be fully depressed (to place overdrive in direct drive), button then pulled out, and accelerator pedal released. NOTE—Lockout will not engage unless overdrive in direct drive (sun gear teeth will strike lock plate clutch teeth causing 'buzzing' sound) and accelerator pedal must be fully depressed to complete lockout engagement.

Adjustment—If dash control button cable is adjusted too short, buzzing sound will be noticed when button pushed all the way in. Noise will disappear when operated with engine pulling car below cut-in speed and will reappear when accelerator pedal released. To adjust cable, turn adjusting nuts at end of cable where it is attached to lever.

Cut-in Speed—25 MPH (governor switch contacts close). Overdrive does not engage until accelerator pedal released momentarily. Overdrive cuts out at 22 MPH (or at any speed if 'kick-down' operated). No cut-in speed adjustment provided.

SERVICING:—Transmission—See separate articles on Lincoln Transmission for servicing data. Transmission is same as standard type (without overdrive) except that mainshaft is extended back into overdrive case and has pinion assembly and freewheel cam mounted on this extension.

Overdrive:—Serviced in same manner as other Warner electrical type overdrives (see preceding article) except for differences in design as detailed above. If overdrive does not operate satisfactorily, determine trouble as follows:

Overdrive remains engaged, Will not 'kick-down', Car will not roll backward in Neutral—Caused by ground in lead between #5 relay terminal and governor switch. Check by disconnecting lead at #5 terminal and noting if relay 'clicks' when wire touched to terminal (click indicates ground or other defect). Check lead, relay terminals, and kickdown switch for grounds (see Special Service Notes above). To check relay, remove fuse. If relay 'clicks' as fuse removed, relay is defective.

IMPORTANT NOTE—If attempt made to reverse car under above conditions (ground in #5 circuit), overdrive unit may be seriously damaged.

Ignition Cuts Out—If left cylinder bank cuts out when idling, check for grounded relay (internally or at terminals #2 & 6), ground between #6 relay terminal and kickdown switch or in kickdown switch, ground in lead between #2 terminal and distributor or within distributor (if ignition restored when lead disconnected from #2 relay terminal, this lead an ddistributor are not at fault). If right cylinder bank cuts out when idling, check for ground in lead between #7 solenoid terminal and distributor, in solenoid, and in distributor (if ignition restored when lead disconnected from #7 solenoid terminal, this lead and distributor not at fault). If one bank of cylinders cuts out when overdrive engaged, check for defective solenoid or ground between solenoid terminal #6 and kickdown switch lower terminals.

Overdrive will not engage—Check for open-circuit between relay terminal #5 and governor switch. Check by grounding #5 relay terminal (relay and solenoid should 'click' simultaneously). If relay does not click, check for blown fuse or defective relay. If relay clicks but solenoid does not, check for defective relay, defective solenoid or open-circuit between #4 relay and solenoid terminals. If both relay and solenoid click but overdrive will not engage, check for jammed solenoid or damage within overdrive unit.

Overdrive will not kick-down—Check for ground between relay and kick-down switch or at upper terminals of kickdown switch (see Special Service Note above). Check for open-circuit between relay terminal #2 and ignition condenser, solenoid terminal #7 and ignition condenser, solenoid terminal #6 and kick-down switch, relay terminal #6 and kick-down switch, or within relay. Check for defective kick-down switch.

FUSE:—20 ampere. In connector in control relay lead.

BUICK 60, 70, 90 TYPE

Used On:

BUICK, SERIES 41-60,70,90 (1941)

TYPE:—Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse), all-helical gear type. Same design as used on 1940 car models with following features:

Shifter Mechanism—New cross-shift mechanism used consisting of vertical shaft in side of transmission case with lever on upper end engaging selector shaft so that movement of the selector lever on the transmission case (small forward lever) shifts the selector shaft sidewise in the transmission to engage the Low-Reverse or Second-High shifter rail.

Synchronizer Cones & Gears—Synchronizing cones have 7° angle and are marked 'S' for use with second speed gear. Service gears are marked '7' and must be used with these cones (do not confuse these gears with types used on previous models).

Countershaft & Reverse Idler Shaft Retainers—Shafts are retained by special grooved lockpin which is driven into hole in case so as to enter hole in shaft. Pin must be driven through into shaft before shafts can be removed and new pin must be used when shafts re-installed.

SERVICING:—Disassembly—Remove cover, drive countershaft locking pin in until it is completely within shaft, use service tool J-1001 (dummy shaft) to drive countershaft out through rear of case leaving tool in countergear cluster until it is replaced in case (tool will retain bearing rollers and spacer). Take out mounting screws and remove universal joint ball and cover, remove speedometer drive pinion, take out screw in end of shaft and pull universal joint yoke, then take out mounting screws and remove rear bearing retainer. Loosen lockscrews in both shifting forks, move synchronizer drum assembly to high gear position. Move entire mainshaft assembly back until forward end clears pilot bearing in drive gear, lift shaft up and to left until fork clears collar on synchronizer, move fork to rear in case. Move shaft to right to clear Low-Reverse shifter fork, move fork forward. Remove synchronizer assembly from shaft. Take out second speed gear snap ring, slide second speed gear forward on shaft, take out low speed gear stop ring. Support gears by hand and withdraw mainshaft and bearing through rear of case. Lift out second speed and low speed gears. Remove main drive gear snap ring (on front of case), tap gear through into case and remove through top. Lift out countergear cluster being careful not to lose steel and bronze thrust washers. To remove reverse idler, drive lockpin into shaft, drive shaft out.

Reassembly—Reassemble transmission in same manner. Use new snap rings at all points if possible. NOTE—Main drive gear snap ring increased in wall thickness and inside diameter. This snap ring and others can be used on previous models but previous type snap rings must not be used on 1941 transmissions.

Mainshaft & Bearing Assembly:—Rear main bearing should be .0007" tight to .0002" loose on shaft and .0002" tight to .001" loose in case. Bearing is held on shaft by universal joint front companion flange and is retained in case by snap ring in groove in outer race which is clamped between case and retainer. Low and reverse gear backlash on shaft should be .003" maximum.

Synchronizer Assembly:—Cannot be dismantled and should be replaced as a unit. Clutch sleeve clearance on mainshaft should be .001-.003" and backlash should be .001-.003".

Main Drive Gear & Bearing:—Bearing is shielded type and should be installed with shielded side toward transmission case. Bearing inner race and oil slinger are retained on shaft by snap ring installed in groove in shaft. Bearing should be .0003" tight to .0007" loose on shaft and .0002" tight to .001" loose in case. Pilot bearing in gear hub is composed of 14 loose rollers which are prevented from moving out by snap ring installed in gear hub.

Countergear Assembly:—Mounted on roller bearings in each end with spacer between bearings. When removing gear cluster, leave dummy shaft or arbor within gear cluster to retain rollers until gears replaced (drive arbor out as countershaft installed). Install roller bearing retaining washer on each end of gear cluster with bronze thrust washer between gears and case (front), bronze washer and steel washer (rear). Use new lockpin to retain countershaft (see lockpin data below).

Shifter Mechanism:—Before removing selector shaft, remove lever on cross-shift (vertical) shaft to permit lever on upper end of this shaft to disengage from selector shaft as shaft is driven out. Remove lever on left end of selector shaft, take out locking screws in each selector cam, drive shaft out through right side of case (shaft will dislodge sealing plug in hole). This is important to avoid damage to oil seal on lever end of shaft. Inner selector shaft and lever can then be lifted out of case. When replacing this lever, make certain that spring washer, plain washer, and seal are assembled on shaft within case. When installing selector shaft, insert shaft through left side of case and close shaft hole on right side of case with sealing compound. See Transmission Control article for adjustments when replacing transmission on car.

IMPORTANT NOTE—Interlock bushing must be installed with large diameter toward transmission case (not toward shifter cam). If reversed, no interlock control of second and high shift rail will result and shift into Low or Reverse may lock gears.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Countershaft & Reverse Idler Retainers:—With countershaft and reverse idler shaft out of engine, remove locking pins from shaft and discard these pins (pins must not be re-used). After shafts reinstalled in transmission case, line up holes in case and shaft, install a new locking pin and drive pin in ⅝-¾" past flush with outer surface of case.

BUICK-OLDSMOBILE-PONTIAC TYPES

Used On:

BUICK, SERIES 41-40,40A,50 (1941)
OLDSMOBILE 6, MODELS 66,76,96 (1941)
OLDSMOBILE 8, MODELS 68,78,98 (1941)
PONTIAC 6, MODELS 41-24,25,26 (1941)
PONTIAC 8, MODELS 41-27,28,29 (1941)

OLDSMOBILE NOTE:—This synchro-mesh transmission is standard equipment on all car models. Hydra-Matic Transmission (with a Fluid Coupling) is optional equipment on these models. See separate article on Oldsmobile Hydra-matic Transmission for data on this type.

TYPE:—Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse), all-helical gear type. Same design as used on 1940 car models with following features:

Shifter Mechanism—New cross-shift mechanism consisting of a vertical shaft on side of transmission case with inner lever at upper end engaging selector shaft so that movement of selector lever on transmission case (small forward lever) shifts the selector shaft sideways in the transmission to engage the Low-Reverse or Second-High shifter rail.

Countershaft Bearings—Countergear cluster now mounted on roller bearings (loose rollers) at either end with spacer on shaft between bearings. Special service tool (dummy shaft) must be used when removing countershaft to retain bearing rollers.

Synchronizer Cones & Gears (Buick only)—Synchronizing cones have 8° angle and must be used with new gears marked '8' (do not confuse these gears with gears used on previous models). Bronze cones must always be used with Second Speed Gear.

SERVICING:—Disassembly—Remove cover, remove speedometer driven gear assembly. Disconnect spring on shifter lever on left side of case. Take out rear bearing retainer screws, set transmission in high gear position (to prevent sliding sleeve and low speed gear from dropping down into case), withdraw bearing retainer, second speed gear, and mainshaft assembly through rear of case. Remove setscrews from shifter forks and selector shaft cams (use tool KMO-244), take out retainer screw and remove lever from left end of selector shaft, remove lever from lower end of vertical shaft (necessary to permit inner lever on upper end of shaft to disengage from selector shaft), drive selector shaft out through right side of case (this is important to prevent damage to oil seal on lever end of shaft), remove selector cams from case. Remove shifter rails through front end of case (Oldsmobile—welch plug in case at front end of Second-High rail must be removed also), rear of case (Pontiac), being careful not to lose detent balls and springs which are located under rails on all models. Lift out shifter forks, sliding sleeve and low speed gear. Use special tool (arbor or dummy shaft) J-1334 (Buick), J-1449 (Oldsmobile & Pontiac) to drive countershaft out through rear of case, leaving tool within counter gear cluster to retain bearing rollers until shaft is replaced. Remove snap ring on main drive gear bearing (on front of case), tap main drive gear and bearing through into case and lift out. Lift countergear cluster out being careful not to lose thrust washers on either end of cluster or bearing rollers. To remove reverse idler, drive locking pin through into shaft, then drive shaft out and lift gear out.

Synchronizing Unit:—No detent springs used. Synchronizer drums are retained on gears by snap rings and may be removed after snap rings are released.

Buick Note—Make certain that drum used on second speed gear is Bronze (aluminum drums used on some models for high gear).

Mainshaft & Bearing Assembly:—Second speed gear retained on shaft by snap ring at forward end and can be removed after snap ring has been taken off (use tool J-1130). To remove bearing retainer, take out bearing snap ring, tap end of shaft on wooden block. Then remove snap ring on shaft at rear of bearing, press speedometer gear, spacer and bearing off shaft (on Buick, speedometer gear is mounted on universal joint yoke which is held on end of shaft by retainer screw and washer). When installing bearing, see that shielded side is forward (toward second speed gear). Bearing should be .0007" tight to .0002" loose on shaft and .0011" tight to .0005" loose in bearing retainer.

Mainshaft Rear Bushing (Oldsmobile 76, 78, 96, 98)—New type steel-backed, bronze bushing used in transmission extension housing to support mainshaft. Bushing can be replaced after oil seal removed from end of housing by using tool J-1450 to remove old bushing and install new bushing. New bushings must be reamed after installation to provide .0025-.004" clearance on shaft (reamer is part of J-1450 tool set).

IMPORTANT INSTALLATION NOTE (OLDSMOBILE)—When transmission installed on 76, 78, 96, 98, fill the transmission rear bearing housing asembly with ½ pint of transmission lubricant after transmission has been installed in car and propeller shaft installed.

Rear Oil Seal (Oldsmobile)—New oil seal must be installed in rear end of rear bearing retainer whenever oil seal removed. Soak new oil seals in engine oil for 5 minutes, install seal with felt to rear using tool J-1050. NOTE—New type oil seal has shoulder which locates it in housing. See that vent in housing is open.

Rear Oil Seal (Pontiac)—Old oil seals can be removed by prying with a screwdriver. Use tool J-1323 to install new oil seals (seal has extension rim which will be damaged if tool not used).

Main Drive Gear & Bearing:—Bearing can be removed from shaft after lock ring has been removed by tapping end of shaft on wooden block. When installing bearing, see that shielded side is toward gear. Bearing should be .0003" tight to .0007" loose on shaft and .0002" tight to .001" loose in case.

Second Speed Gear:—Clearance on shaft should be .001-.0026" (Buick), .0005-.0027" (Pontiac). Endplay should be .000-.010". When installing gear, make certain that thrust washer installed in front of gear, use special thimble J-1267 (Oldsmobile) to start snap ring on end of shaft.

Countergear Assembly:—If rollers removed from gear cluster, use arbor as assembly tool, make certain that spacer and thrust washers assembled in gear cluster, then install rollers, using grease to retain them in place. Install assembly in case, making certain that small steel thrust washer installed next to bearing rollers and large bronze thrust washer between gear cluster and case at each end, insert countershaft from rear and push arbor out through front of case. See that lock ball in place in rear end of shaft and that ball engages groove in case to prevent shaft from turning. Countergear clearance should be .0005-.0024". Endplay should be .0076-.0196" (Buick), .009-.021" (Pontiac).

Shifter Mechanism:—Selector shaft must be removed when transmission is disassembled (see Disassembly directions above). To remove shaft, use KMO-244 tool to remove shifter cam setscrews, remove lever on left end of shaft by taking out retainer screw, remove lever on lower end of cross-shift shaft (necessary to allow inner selector lever on upper end of shaft to disengage from selector shaft). Drive selector shaft out through right side of case (this is important to avoid damage to oil seal on lever end of shaft). With selector shaft out, inner selector lever and shaft can be lifted out. See that this shaft and hole in case are clean, lubricate with Lubriplate when shaft replaced being certain that spring washer, plain washer and oil seal installed on upper end of shaft within case. Install selector shaft through left side of case and use sealing compound to close hole on right side (this hole originally closed by plug which will be driven out when shaft removed. CAUTION—When installing lever on selector shaft, hold shaft with wrench to avoid damaging selector cams and make certain that lockwasher installed on lever retainer screw. This lockwasher is very important to prevent lever loosening in service.

CADILLAC STANDARD TYPE

Used On:

SERIES 41-60S, 61, 62, 63, 67, 75 (1941)

HYDRA-MATIC DRIVE TRANSMISSION NOTE:—Special Hydra-Matic Drive Transmission is Optional Equipment on all models. See separate article for adjustment and servicing data on this Hydra-Matic Drive Transmission.

TYPE:—Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse), all-helical gear type. Same design as used on 1940 models.

SERVICING:—Disassembly—Remove speedometer driven gear adapter housing and gear. Take out retaining screw and remove universal joint flange on rear end of shaft, remove extension housing capscrews and pull extension housing off shaft. Remove transmission bottom cover, drive countershaft out through rear end of case, remove countergear cluster, thrust washers, and bearing rollers. Take out lockscrews in front end of case, pry main drive gear and bearing out of case toward front, remove synchronizer assembly from front end of mainshaft. Use Tool J-1007 to remove lock ring in front of second speed gear, tap mainshaft and bearings out through rear of case (second speed and low speed gears will slide off shaft and should be removed from case). Tap reverse idler shaft out through rear of case and remove reverse idler gear and thrust bearing. Loosen clamp bolts and remove

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

levers on shifter shafts, remove shifter lever shafts through inside of case being careful not to lose interlock spring, balls, and tube.

Reassembly:—When reassembling transmission, note the following points:

Shifter Shafts & Levers—Install Second-High lever first, see that shaft in neutral position and shoe in place on inner end of shaft. Install interlock assembly, compress interlock spring and install Low-Reverse shifter shaft, see that shaft in neutral position (interlock ball engaging center notch in shaft sector) and that shoe in place on inner end of shaft. Install new cork seals on outer ends of shafts (use tool J-1169) and install levers.

Reverse Idler Gear—Start shaft in through rear of case, install rear steel backed-babbitt thrust washer on shaft with clip in washer fitting into slot in case, install new cork seal on outer end of shaft. Install gear on shaft, use pilot tool J-1010 to hold front thrust washer in position while shaft is tapped into place, see that locking screw hole in shaft and case line up (shaft locked by long cover screw which must be installed in this hole). Idler gear bushing clearance on shaft is .002-.0035" (new), .005" (worn limit). Gear endplay should be .005-.010" (new), .015" (worn limit). Gear backlash should be .008-.010" (new), .011" (worn limit).

Mainshaft Assembly—When installing mainshaft, hold low speed and second speed gears in position and engaging shift lever shoes, insert shaft through gears. Use tool J-1007 to install new second speed gear lock ring, tool J-1170 to install mainshaft front roller bearings in main drive gear (bearing rollers held in place by lock ring). Low speed gear backlash on mainshaft splines should be .004-.007" (new), .010" (worn limit). Synchronizer hub backlash on mainshaft splines should be .0005-.001" (new), .003" (worn limit). Second speed gear clearance on mainshaft should be .001-.0015" (new), .00175" (worn limit) and endplay should be .004-.008" (new), .012" (worn limit).

Countershaft Assembly—Start countershaft through rear end of case, install needle bearings and retaining washers in countergear cluster with tool J-1184, place bronze thrust washers in position on each end of gear cluster and steel thrust washer on rear end, tap countershaft into place in gear cluster with new cork seal on end of shaft, see that locking hole in shaft and case line up (shaft locked by long cover screw which must be installed in this hole). Countergear endplay should be .005-.012" (new), .018" (worn limit). NOTE—If endplay exceeds .018", install oversize thrust washer.

Extension Housing & Oil Seal—Install extension housing on transmission case and tighten mounting screws securely. Then install oil seal in rear end of housing using tool J-1354. Extension housing bushings are not furnished separately and housing should be replaced on exchange basis if bushing require replacing.

NOTE—Extension housing used on approximately first 3500 cars in 1941 permits use of speedometer pinion for standard rear axle ratio only and housing must be replaced if optional rear axle installed. Second type housing (with provision for installation of optional axle ratio speedometer drive pinions) only is furnished for service and is marked 'R' on case under speedometer cable opening. See Cadillac Shop Notes in 'M' Section for complete extension housing data.

CADILLAC & OLDSMOBILE HYDRA-MATIC DRIVE

Optional Equipment On:

OLDSMOBILE SIX & EIGHT, ALL MODELS (1941)

CADILLAC, ALL MODELS (1941)

IMPORTANT SERVICE NOTE:—Towing Car—Control lever must be placed in 'N' (neutral) position if car is being towed.

Starting Engine by Pushing or Towing Car—Control lever should be placed in 'N' (neutral) position until car speed of approximately 20 MPH. is reached, control lever should then be moved to 'HI' position and engine will be cranked through gears.

Parking With Transmission in Gear—To park car in gear (for parking on hills), engine should be stopped with control lever in forward driving position (HI or LO), control lever should then be moved to 'R' reverse position. This locks the drive system so that car will not move.

Reverse Shift—To engage reverse, with car completely stopped, control lever should first be moved momentarily to 'LO' position and then quickly and firmly moved to 'R' position.

DESCRIPTION & OPERATION:—The 1941 type Hydra-Matic Drive is similar to design used on 1940 Oldsmobile models (see Cadillac Note below) except for new Starter Interlock as follows:

Starter Interlock—Consists of a bellcrank linked to the starter motor pinion shift lever which 'kicks' the steering column control lever into the 'N' or neutral position when the starter pedal is depressed to start the engine (if control lever has been left in any other position than neutral). This linkage is adjustable (see Adjustment directions below).

Cadillac Type—Cadillac Hydra-Matic Drive is similar in design to Oldsmobile type except for heavier construction and special double reduction or two-unit rear planetary unit (consists of two sets of planetary gears in tandem). This type also has Interlock device which prevents starting of engine unless control lever is in Neutral.

ADJUSTMENT (OLDSMOBILE):—Linkage should be checked, and adjusted if necessary, whenever it has been disconnected or disturbed by removal of other units, carburetor adjustment, etc. Adjust linkage exactly as follows:

Manual Control Lever Linkage:—Remove clevis pins to disconnect lower control rod (forward rod) at intermediate lever on lower control relay bracket (on cross-member at left of flywheel housing) and lower control relay rod (rear rod) at shift lever (inner lever) on left side of transmission case. Set control lever on steering wheel in 'R' (reverse) position and make certain that poppet ball engages detent notch. Move intermediate lever so that hole in lever lines up with hole in bracket, insert special gauge No. J-1469 through both holes to hold lever in this position while adjustments are being made. Move manual shift lever on transmission (inner lever on outside of case) toward rear as far as possible (to make certain that lever is in extreme rear position, rotate propeller shaft by hand until pawl is felt to engage and lever is against stop). Adjust lower control relay rod length (loosen locknut and turn clevis on rear end of rod) so that rod can be connected to transmission lever without disturbing lever position, connect rod being certain that waved (anti-rattle) washer is in place and that clevis locknut is tightened. Remove tool J-1469 from intermediate lever, press back on intermediate lever so that rear rod and manual shift lever held in rear position against reverse stop, adjust length of lower control rod (forward rod) by loosening locknut and turning clevis on rear end of rod so that rod can be connected without disturbing position of steering column lever or intermediate lever. Connect rod making certain that waved (anti-rattle) washer is in place and that clevis locknut is tightened. Check control lever in all positions to make certain that it operates freely.

Throttle Control Linkage:—Disconnect transmission throttle rod at lever on left side of transmission case (outer lever). Set carburetor throttle stop-screw for 375 RPM engine speed in neutral (hot or slow idle speed—see Oldsmobile article for carburetor adjusting directions). Remove trunnion nut lock on idler lever at rear end of carburetor throttle rod (right side of cylinder head), adjust length of throttle rod by turning trunnion nut until special gauge J-1469 slips freely through holes in accelerator linkage bellcrank and bracket (on left side of engine), tighten trunnion lock and remove gauge. Move transmission throttle lever (outer lever on left side of transmission case) to extreme rear position against idle stop, and with carburetor in slow or hot idle position, adjust length of transmission throttle rod by loosening locknut and turning clevis on rear end of rod so that rod can be conected without disturbing position of levers, then **shorten rod by one additional full turn of the clevis**, tighten locknut and connect rod by inserting clevis pin and installing cotter pin. Adjust rod connecting accelerator pedal idler lever and bellcrank on left side of engine so that clearance between idler lever and bead on toepan is 3/32-5/32" with carburetor in slow or hot idle position. Adjust Throttle Cracker and Fast Idle (see Carburetor adjusting instructions in Oldsmobile article).

Starter Interlock Adjustment:—This adjustment should be made only after manual control has been properly adjusted (see above). Disconnect battery cable at starter motor (to prevent starter cranking engine), place steering column control lever in 'N' or neutral position, fully depress starter pedal and hold pedal in this position while adjustment is being made. Adjust length of rod linking starter pinion shift lever and interlock bellcrank so that clearance between face of bellcrank and lower face of steering column control shaft shift lever is .030-.060". Check operation by placing steering wheel control lever in all other positions than neutral. If control is not returned to neutral 'N' position in each case, recheck adjustment.

ADJUSTMENT (CADILLAC):—Adjust linkage exactly as directed below.

Manual Control Lever Linkage:—Remove clevis pin from lower end of lower control rod (at transmission manual shift lever). Move steering wheel control lever in Reverse position. Move manual shift lever on transmission to rear as far as possible (Reverse position), check this by rotating propeller shaft by hand until reverse anchor is felt to engage. Adjust clevis on lower end of control rod so that clevis pin can just be inserted without disturbing

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

position of rod or lever, connect rod. Check control lever for free operation in all positions.

Throttle Control Linkage:—Make certain that carburetor set for hot or slow idle speed of exactly 375 RPM (use tachometer such as KMO-298 electric type). See that throttle valve completely closed with stopscrew against low step of fast idle cam. Remove cotter pin and anti-rattle spring from upper end of intermediate throttle rod and disconnect throttle rod at transmission lever (lower lever on transmission case). Snap special adjusting tool J-1653 in place on upper end of intermediate throttle rod at relay shaft lever on front of dash. Loosen locknut and turn adjusting nut on carburetor end of throttle-to-relay rod until the adjusting tool contacts both the relay shaft at the distributor support and the projection on the intermediate throttle rod. See that throttle lever on transmission case is moved to rear as far as possible, adjust trunnion on transmission end of throttle rod so that pin can be installed without moving throttle lever from rear position against stop and without disturbing linkage, connect rod. Remove adjusting tool, re-install cotter pin and anti-rattle spring.

SERVO-BAND ADJUSTMENT (ALL MODELS):—Servo-bands should be adjusted at end of first 5000 miles and at 10,000 mile intervals afterward. Oil must be drained and oil pan must be removed for this adjustment (can be combined with regular draining and refilling operation).

CAUTION—Front and rear servo bands are adjusted differently and each band must be adjusted exactly as directed below. No band is used on the Reverse planetary unit (pawl on case locks ring gear by engaging teeth on rim of gear).

Front Servo Band—Remove transmission case oil pan and snap-in cover in floor pan over adjusting screw. Loosen adjusting screw locknut, install special adjusting tool J-1459 over capscrew in front unit (insert tool from below through oil pan opening), tighten adjusting screw on top of case until front unit drum just cannot be moved in either direction, then **back off adjusting screw exactly 8 turns,** tighten adjusting screw locknut taking care that adjusting screw does not turn. NOTE—It is extremely important that adjusting screw be backed off exactly 8 turns from point where drum just cannot be turned—mark screw position at this point and count turns carefully as screw is backed off.

Rear Servo Band—Remove transmission case oil pan and snap-in cover in floor pan over adjusting screw. Use servo cam release bar and force rear servo plunger into servo beyond servo gauge. Loosen adjusting screw locknut and turn adjusting screw down to take up all slack in servo band. Install special servo gauge J-1460 on bottom of servo, back off adjusting screw until end of servo plunger is flush with outer edge of gauge (plus or minus 1/32"), tighten adjusting screw locknut. Check adjustment by working servo plunger with cam release bar.

LUBRICATION:—Hydra-matic drive case should be drained and refilled with new Hydra-matic Drive Fluid at end of first 5000 miles and at 10000 mile intervals afterward (Oldsmobile), end of first 6000 miles and at 12,000 mile intervals (Cadillac). Servo-bands can be adjusted at same time with oil pan off—see above. Fluid level should be checked at 1000 mile intervals (Cadillac), 2500 miles (Oldsmobile) and fluid added to keep level at 'full' mark as follows:

Checking Fluid Level—Run engine for several minutes, then stop engine and allow car to stand for at least one minute before checking level (this is important because transmission fluid is supplied to the fluid coupling and fluid coupling must be full of oil when checked). Remove sheet metal cover in floor pan over fluid level indicator (right front corner of transmission case), remove indicator to check level. Keep level at 'Full' mark on indicator.

Draining Hydra-matic Drive—Transmission case and fluid coupling are drained separately. Remove plug at front end of oil pan (to drain transmission), on front face of flywheel (to drain fluid coupling). NOTE—When refilling after draining transmission, add 6 qts. of fluid (Oldsmobile), 8 qts. (Cadillac), run engine for approximately 5 minutes, then add remainder of fluid (see Capacity data below).

Capacity (Cadillac)—11½ qts. when unit has been drained. Use only Cadillac Hydra-Matic Fluid (one type for all-season use).

Capacity (Oldsmobile)—9 qts. (when transmission case and fluid coupling have been drained), 9½ qts. (if oil pan has also been removed for cleaning), 10 qts. (if transmission has been disassembled). Use only Oldsmobile Hydra-Matic Fluid (one type for all-season use). NOTE—For emergency use only, transmission can be operated with good quality SAE. #20W engine oil. Replace oil as soon as possible with genuine Hydra-Matic Fluid.

CHECKING OIL PRESSURE:—If transmission operation not satisfactory check to make certain that oil pressure sufficient for correct operation as follows:

To Check Oil Pressure—Use special service fixture J-1467 and a reliable 100 lb. oil pressure gauge. Remove the plug on the transmission side cover plate, remove plug from governor sleeve by threading standard ¼" capscrew into plug and removing plug through side cover plate hole. Assemble J-1467 fixture in place in side cover plate and governor housing using extreme care not to cause any bind in governor assembly. Assemble pressure gauge to fixture plug so that gauge can be read while car being operated. Operate car on road until transmission fluid is hot, see that control lever in high range, allow car speed to drop to 20 MPH and note gauge reading. Oil pressure must not be less than 75 lbs. (Cadillac), 78 lbs. (Oldsmobile) at 20 MPH.

Low Oil Pressure Correction—If pressure less than 75 lbs., check for excessive oil leakage in transmission or oil regulator valve assembly, see that oil regulator valve body is tight, check for sticking regulator valve or weak valve spring (substitute new spring and recheck pressure). Inspect for leak in main control valve body or at delivery tube connections between main control valve body and governor sleeve.

TRANSMISSION REMOVAL (OLDSMOBILE):—Raise car and jack up all four wheels securely approximately 8" above floor. Remove foot accelerator pad, floor mat, center floor pan. Disconnect propeller shaft at rear universal joint, remove by sliding shaft out at splined joint. Remove flywheel housing pan. Drain transmission and flywheel by taking out both drain plugs. Remove outer throttle lever from transmission case, disconnect control rod from manual shift lever. Remove two upper engine mounting bolts, remove master cylinder to brake shaft bracket, disassemble strut from shaft, remove clevis pin from lower control relay rod. Raise engine approximately 1" off mountings with jack just forward of crankcase drain plug (use block of wood on jack). Remove 3 bolts from each side of cross-member at frame side rail, remove cross-member by tipping top toward front of car and moving cross-member forward. Install transmission lifting tool J-1129 in front compartment over floor pan opening (CAUTION—use safety extension legs J-1129-40-1). Place saddle at bottom of transmission, work cables through pan opening and hook both cables onto lifting tool cable snap. Center saddle on transmission pan, hoist transmission just enough to take strain off mounting bolts, remove 5/16" bolts holding fluid flywheel cover on flywheel, remove five ½" bolts holding rear half of bell housing to front half. Lower engine slightly until top of bell housing is flush with top of opening in floor pan, thread two standard transmission bolts into bell housing (on each side just above dowel pins) to force bell housing from dowel pins, then remove these bolts. Remove transmission and rear bell housing as an assembly by moving it toward rear of car and lowering to floor.

TRANSMISSION REMOVAL (CADILLAC):—Raise car and jack up all four wheels securely approximately 8" above floor. Remove floor carpet and pads, front seat cushion, and center floor pan. Disconnect propeller shaft at front universal joint and remove shaft, remove flywheel housing pan. Drain transmission and fluid flywheel by taking out both drain plugs. Support rear end of engine with jack under oil pan (use block of wood on jack). Disconnect engine rear support at transmission extension, remove cross-member and rear support. Remove throttle lever on side of transmission case, disconnect control rod from shift lever, disconnect speedometer cable. Install transmission hoist J-1616 in front compartment over floor pan opening, screw eyebolt securely into top of transmission, attach hoist cable hook to eyebolt, lift transmission just enough to take strain off mounting bolts. Remove 30 5/16" capscrews holding flywheel cover to flywheel. Lower jack under engine until top of bell housing is just flush with top of floor pan opening. Remove 6 bolts holding bell housing to engine crankcase. Remove transmission by shifting it backward and lowering to floor.

SERVICING:—Front Servo—To disassemble after removal from transmission, remove oil suction line, take out pump cover attaching bolts, remove pump cover. Remove servo pistons, springs and oil pump gear from housing. When assembling, install servo piston and sleeve in housing, slip retracting spring over piston shaft. Install oil pump idler gear. Install accumulator piston, booster spring, booster spring retainer in servo unit cover, install cover assembly in servo housing, tighten cover bolts. Install suction line making certain that gasket is in good condition. When installing servo in transmission case, see that plunger enters anchor on brake band. Adjust servo after installation.

Rear Servo—To disassemble after removal from transmission, place servo in arbor press and hold squarely in steady position on baseplate so that tension removed from spring retainer. Remove retainer screws, release pressure slowly and guide accumulator body out of servo, remove all parts. When assembling, install booster piston, booster spring, large initial spring, accumulator and piston body in servo body, centering small ring on booster spring so that it enters accumulator body freely. Hold accumulator in place on servo, install inner and outer servo springs and spring retainer. Compress assembly in arbor press and tighten spring retainer screws. Adjust servo after installation in transmission.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Fluid Coupling—To remove fluid coupling members with transmission off car, place manual shift lever in reverse position, loosen mainshaft locknut washer. Use tool KMO.334 to remove locknut retaining driven member (runner) on front end of mainshaft, slide driven member off. Remove drive member (driver) by gripping vanes with pliers at 2 diametrically opposite points and pulling forward while tapping on end of mainshaft with bronze hammer (CAUTION—do not attempt to remove drive member by pushing or pulling on flywheel cover—this will damage oil seal rings).

CHEVROLET THREE-SPEED TYPE

Used On:

MASTER DELUXE AG, SPEC'L DELUXE AH (1941) ½ TON AJ,AK; ¾ TON AL,AN (1941)

NOTE:—Passenger Car Models—These models have new type Shifter Mechanism mounted in side cover on transmission case (no top cover used). All service replacement gears are Carburized type (same as used in Truck transmissions).

Truck Models—Same design as 1940 with conventional shift lever mounted on top cover. All gears are Carburized type (carburized gears furnished for passenger car transmission service also).

Transmission Extension (all models)—All transmissions have extension on rear end so 4 speed transmission can be installed without difficulty on truck models. NOTE—When installing 4 speed transmission on ½ Ton Models, new brake master cylinder must be installed. Special speedometer gear adapter and new speedometer gears must be installed on all models.

Vacuum Power Gearshift (Passenger Cars)—See separate Chevrolet Transmission Control article for complete adjustment, disassembly, and servicing directions.

SPECIAL SERVICE NOTES & PRODUCTION CHANGES:—1940 High Gear Disengagement Complaints—To correct complaints of transmission disengaging in High Gear position, check the following points first: Check Vacuum Cylinder Valve Setting and install No. 3655072 Valve Friction Spring on valve rod (see Chevrolet Transmission Control article for data), check run-out of transmission pilot face on clutch housing and shim between clutch housing and transmission if run-out exceeds .008". If this does not correct complaint, install following parts (furnished in Unit Package No. 605021): Main Shaft, 2nd. & 3rd. Speed Clutch & Synchronizer Assembly, Clutch Gear. New main shaft and clutch are 1941 type with 6 splines (instead of 18) and have ground lands.

Serviceable Interlock Lever & Shaft—On late 1940 cars (as on 1941 models), shifter interlock lever is clamped on shaft by ¼x28x¾" bolt and can be removed so that these parts can be serviced separately (complete cover must be replaced on first type with welded shaft and lever).

Countergear Assembly—On trucks, countergear is mounted on roller bearings and this type countergear only is furnished for service on all models. See special service data below for countergear servicing when roller bearings used.

TYPE:—Constant-mesh, synchro-mesh (Second and High), sliding gear (Low and Reverse), all-helical gear type. Design changed from type used on 1940 models as follows: Shifter interlock lever clamped on shaft by clamp bolt instead of being welded (parts can be serviced separately), mainshaft now has 6 splines instead of 18 and lands between splines ground for more accurate centering of 2nd. and high clutch (see 1940 Special Service Note above), shifter yokes are 'granodized', Reverse Idler Gear bushings staked in place to prevent loosening in service, and speedometer drive gear now mounted on universal joint spacer (instead of on yoke).

SERVICING:—Disassembly—On Pass. cars, take out screws and remove shifter cover on left side of case (see Shifter servicing data below). On trucks, take out screws and remove gear shift lever and transmission cover assembly (turn screws out evenly to relieve spring pressure), remove shifter shafts and forks (see Shifter servicing data below). On all models, remove universal joint capscrew and washer, slide joint off shaft. Remove drive gear bearing retainer screws on front of case, take off retainer. Mark main drive gear, second speed gear, and both synchronizing rings to insure reassembly in same relative positions. Use special puller, J-937, to remove clutch shaft and main drive gear bearing, take out 14 loose rollers (mainshaft front bearing). Use special tool, J-938, installed on back of transmission case and push mainshaft out toward front (IMPORTANT—front synchronizer ring must be turned so that lugs line up with slots in splines on mainshaft to avoid damage to lugs and splines), remove mainshaft from front end. Engage second speed gear and clutch sleeve, remove clutch sleeve assembly, low and reverse gear, second speed gear from case as a unit, remove second speed gear thrust washer. Expand rear bearing lock ring into case (use tool J-935), tap bearing out toward front (bearing must be removed before countershaft can be removed). Drive countershaft out toward front. To remove reverse idler, drive idler shaft lockpin into shaft (pin shorter than shaft diameter), drive out expansion plug at rear of case, remove idler shaft through this hole.

Main Gear Drive & Clutch Shaft Bearing:—Bearing retaining nut and oil-slinger are single unit with left hand thread and are staked in hole in shaft. Use special press-plate J-936 to press bearing on or off shaft. Bearing retainer mounting holes on front of case spaced irregularly to insure assembly in correct position (to align oil return holes).
NOTE—Special Malleable Iron Clutch Gear Bearing Retainer, No. 604932, available for installation on all 1940 & 1941 Three-Speed Transmissions for severe service (will prevent lubricant loss due to cracked retainers).

Clutch Sleeve & Synchronizing Rings:—To disassemble rings, turn ring until ends of ring retainer is visible through slot in sleeve, insert special pliers J-932 in slot, expand retainer to free ring, pull ring out. See that synchronizing cones are tight in sleeve (replace clutch sleeve and cone assembly if cones loose or worn). Check rings to see that they do not rock in cones.

Energizing Springs:—Use new spring whenever spring is removed. When installing springs, do not expand more than necessary to clear clutch teeth. Install springs with offset end between fourth and fifth teeth of any bank of the clutch teeth (offset prevents spring rotation).

Mainshaft & Rear Bearing:—To install bearing, first install bearing lock ring in case, expand lock ring with tool J-935, tap bearing on outer race with soft steel drift until it is halfway in case, release snap ring, continue to tap bearing until lock ring engages slot in bearing race. Lubricate second speed area of mainshaft, install shaft with lugs on front synchronizer aligned with slots in mainshaft spline (to avoid damage to lugs and splines), use replacing tool J-938 to pull shaft into place. Second speed gear endplay should be .010" with shaft installed.

Counter Gear Cluster:—Bushings staked in place and diamond-bored after installation. Not sold separately. Clearance on shaft .002-.004". When installing countershaft, see that thrust washers are in place at each end of counter gear cluster and that flat on forward end of shaft is horizontal and on top (flat engages clutch housing to prevent shaft turning, transmission cannot be installed unless flat properly located).
Roller Bearing Type—Used on trucks and furnished as service replacement on Passenger cars (Carburized Gear type). To install bearing rollers, install shaft in countergear cluster, coat roller recess with cup grease, install 25 rollers in each end, remove countershaft and install gear cluster in transmission case. Install forward thrust washer between gears and case (lubricate washer), feed assembly tool T-1617 in from front end (tapered end first), lubricate countershaft and install at front end and pushing assembly tool out at rear end (lubricate rear thrust washer and install in case before assembly tool reaches this point). See that flat on forward end of shaft is horizontal and flush with case (not more than 1/64" below face).

Reverse Idler Gear:—Remove old lockpin from shaft before installing, line up holes in case and shaft, use new lockpin and drive pin in so that head is approximately 1/16" beyond surface of case, peen hole to prevent pin coming out. Pin must be tight in hole to prevent oil leaks.

Shifter Mechanism (Passenger Cars):—Consists of two shifter forks on 'I' beam type guide bar bolted on inner face of transmission side cover. Forks are operated by toggle lever in cover and one fork is locked by cross-shift lever while the other fork is being moved to engage gears (cross-shift lever has short arc between slots in gears).
Disassembly—With cover off transmission case, remove two bolts holding guide bar and shifter fork assembly on cover, remove assembly, lift shifter yoke lever, anti-rattle spring, and operating shaft out. Slide shifter forks off guide bar being careful not to lose shift lock balls and spring (in hole in guide bar under forks). Wash all parts in gasoline.
Reassembly—Install long shifter fork on guide bar with fork end toward nearest mounting screw hole, line up lock ball recess in fork with hole in guide bar, install one lock ball and spring in hole, start opposite shifter fork on guide bar, assemble other lock ball on spring, use flat tool to compress spring and slide fork into position over lock ball. Check operating shaft cork seal and retainer, replace if worn. Install operating shaft in cover, assemble anti-rattle spring and shifter yoke lever on bell crank end of operating lever, move selector (cross-shift) bell crank over center of shifter yoke lever. Press on outer end of operating shaft so that shifter yoke lever held firmly against selector lever bell crank, make certain that both shifter forks in neutral position on guide bar, then assemble guide bar and shifter fork assembly on cover with low-reverse shifter fork toward bottom (narrow side) of cover. Make certain that selector lever bell crank engages slots in shifter forks and that pins in forks engage slots in end of shifter yoke lever. Bolt guide bar to cover. CAUTION—Low-reverse sliding gear and clutch sleeve must be in neutral position when

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

shifter mechanism installed on transmission case. See Chevrolet Vacuum Power Transmission Control article for adjustment of gearshift levers when transmission installed on car.

Shifter Mechanism (Trucks):—Shifter shafts must be removed from front end of case (.003" larger diameter at this end) and can be driven out with a soft steel drift. Shafts are locked in place by two long cover screws which engage holes in shafts (see that holes in case and shafts line up when installed).

CHEVROLET FOUR-SPEED TRUCK TYPE

Used On:

1½ TON & CAB-OVER-ENGINE TRUCKS (1941)

NOTE:—This Transmission is Optional Equipment on ½ and ¾ Ton Truck Models.

SPECIAL SERVICE NOTES & PRODUCTION CHANGES:—Low & Reverse Gear Ratio Change—Gear ratio of Low Gear changed from 7.226 to 7.06 to 1, and ratio of Reverse Gear changed from 7.148 to 6.98 to 1 in production (first type same ratio as 1940 and previous transmissions). These new gear ratios used on transmissions beginning with Transmission Serial No. 7108902 (number stamped on left side of case at rear just below cover). New gears in first transmissions (Serial No. 7108902 to 7114663) not marked but can be identified by transmission serial number and fact that low-reverse sliding gear has 42 teeth. Beginning with Serial No. 7114664, gears marked for identification as follows:

Countershaft & Low Speed Gear—Two grooves in shaft at point between low speed and second speed gears.

Reverse Idler Gear—Two similar grooves on shaft between gears.

Low, Second, Reverse Sliding Gear Assembly—Not marked but may be distinguished by larger low & reverse gear with 42 teeth (first type gear had 43 teeth).

CAUTION—Both types of gears furnished for service and care must be taken to install correct type in each transmission.

TYPE:—Four speed, sliding spur gear type. Same design as used on previous truck models except for new universal joint yoke and oil seal on 1½ ton models only which have Hotchkiss drive and open propeller shaft.

SERVICING: — *Refer to 'Chevrolet Four Speed Truck Type' Transmission article in Mechanical Equipment Section of manual for complete data and note following new data:*

Universal Joint Yoke & Oil Seal—Take out capscrew in end of shaft, pull universal joint yoke with finger type puller. To replace grease retainer, press speedometer drive gear from universal joint yoke, slip old grease retainer off hub. Soak new oil seal in light engine oil for 1 hour, install on yoke hub, press speedometer gear on yoke with chamfered edge toward front of transmission.

CHRYSLER-DE SOTO-DODGE-PLYMOUTH STANDARD TYPE

Used On:

CHRYSLER 6, C28 (1941)—SEE NOTE
CHRYSLER 8, C30 (1941)—SEE NOTE
DE SOTO, MODEL S8 (1941)—SEE NOTE
DODGE, MODEL D19 (1941)
PLYMOUTH, MODELS P11, P12 (1941)

NOTE:—Chrysler 6 & DeSoto Models—Vacamatic Underdrive (Chrysler 6), Simplimatic Underdrive (DeSoto) Transmissions optional on these models. See separate article for complete data on these models.

Chrysler 8 Model—Vacamatic Overdrive Transmission optional on this model and Std. on Model C33. See separate article (following) for complete data on this model.

TYPE:—Constant-mesh, synchro-mesh (Second and High), sliding gear (Low and Reverse), all-helical gear type. Same design as used on corresponding 1940 car models with Double-blocker, double-spring type synchronizer unit.

SERVICING:—Disassembly—On cars with Power Shift, remove link from selector lever, remove power shift assembly. Then remove speedometer drive pinion, remove nut on rear end of driveshaft. pull universal joint yoke flange and brake drum assembly. Take out two plugs on transmission side cover, remove detent balls and springs, remove cover and gear selector assembly. Unscrew shifter fork guide rail and remove guide rail through front end of case. See that gears in neutral, take out lockscrews holding shifter forks on shift rails, remove welch plug in lower shifter rail hole on front of case (collapse plug by striking in center with punch), remove shifter rails through front of case, remove plug on top of transmission case and take out interlock plunger (between rails). Take out capscrews in extension housing on transmission case, remove extension and mainshaft assembly through rear of case using care that synchronizer assembly does not slide off shaft. Use special arbor C-578 and soft hammer to drive countershaft out toward rear of case (remove locking key from shaft as soon as it is exposed at rear of case), allowing counter gear cluster to drop down in case. Take out mounting screws and remove main drive gear bearing retainer from front end of case, pull main drive gear and bearing assembly out toward front. Lift counter gear cluster, thrust washers, and bearing rollers out of case. To remove reverse idler, drive shaft out toward rear (remove locking key from shaft when exposed at rear of case), lift out idler gear, thrust washers and bearings rollers.

Mainshaft & Bearing Assembly:—To remove mainshaft from extension housing, take out snap ring at forward end of synchronizer unit, remove synchronizer assembly, second speed gear, and low speed gear from shaft. Remove snap ring in housing in front of bearing outer race, withdraw shaft from housing, then remove bearing, spacer, and speedometer drive gear from housing. Remove oil seal and bearing from rear end of housing (bearing is press fit in housing and is positioned by spacer on shaft—no snap rings used). When reassembling mainshaft, use new snap rings. If oil seal being replaced, soak leather in thin oil for 30 minutes and work leather with smooth bar. Seal must protrude 7/32" from end of case (use C-579 drift to install seal). If driven in too far, seal and bearing will be damaged.

Synchronizer Assembly:—Install struts or shifting plates in slots in inner clutch sleeve with open face of strut in, assemble outer clutch sleeve and synchronizer springs making certain that hooked ends of both springs engage same strut, install synchronizer rings with notches engaging ends of struts. Synchronizer assembly is retained on shaft with second speed gear by single snap ring (see Second Speed Gear below).

Second Speed Gear:—Gear endplay on shaft should be .003" min., .008" max. To install gear, place gear on shaft, install synchronizer assembly, install snap ring in groove in shaft in front of synchronizer.

Main Drive Gear & Bearing:—Bearing retained on shaft by snap ring and can be removed after snap ring taken out and thrust washer removed. Use snap ring when re-installing bearing. Mainshaft pilot bearing rollers are retained in drive gear recess by snap ring. Use cup grease to hold rollers in position until mainshaft is installed.

Counter Gear Cluster:—When replacing this assembly, use arbor C-578 to position bearing rollers and pack rollers with cup grease to hold rollers in place. Install steel washer next to gear cluster at each end and bronze thrust washer between steel washer and case. Endplay should be .002" min., .008" max. Adjust by selecting washers of correct thickness (furnished in three thicknesses—'A' thinnest, 'B', 'C' thickest). Make certain that locking key is in place in slot in rear end of countershaft when shaft installed in case.

Reverse Idler Gear:—Use C-464 arbor to retain bearing rollers when idler gear being installed. See that thrust washer installed at each end of gear and that locking key is in place in rear end of shaft.

Gearshift Mechanism:—To assemble gearshift mechanism, hold shifter forks in position and insert guide rail through front end of case. Install lower shift rail, insert interlock plunger down through hole in top of case so that plunger engages groove in shift rail, then install upper shift rail (see Note below). Lock shifter forks to rails by installing lockscrews and locknuts, make certain that locking washers are crimped in place. Install welch plug in forward end of lower shift rail. CAUTION—This hole is below lubricant level and plug must be installed tightly to prevent lubricant loss. Install two C-590 cover locating pilots in cover screw holes on case, install cover and gear selector assembly, making certain that selector lever enters shifter fork slots. Install two cover capscrews, remove pilots, install remaining cover screws. Install detent balls and springs, tighten retaining plugs. ***See Chrysler Transmission Control article for adjustment directions when transmission replaced on car.***

Shift Rail Note—Rails are similar in appearance but Low-Reverse rail has detent grooves farther apart. This rail should be installed on top.

CHRYSLER 8 VACAMATIC TYPE

Optl. or Std. Equipment On:

CHRYSLER, C30 TRAVELER & NEW YORKER ('41)
CHRYSLER, C33 CROWN IMPERIAL (1941)

CONTOL BUTTON NOTE:—Button marked 'OD' (at left of steering column can be pulled out—but only when car is standing still—to lockout 2nd & 4th Speed (free-wheeling gears) if desired. Button can be pushed in (to make 2nd & 4th Speeds operative) at any speed under 27 MPH. with the clutch disengaged.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Starting Engine by Pushing or Towing Car—Control button must be pulled out to insure transmission being in 1st or 3rd gear (2nd & 4th are freewheeling and will not crank engine). CAUTION—Above data applies only to Vacamatic Transmission on Chrysler Eights. *See 'Important Note' at beginning of following article for Control Button data on Chrysler Six which operates differently.*

TYPE:—New type 4 Speed & Reverse Transmission consisting of a two-speed manually controlled unit in conjunction with an Automatic Overdrive unit which provides two additional speeds (similar to previous 3 speed and Overdrive models except that Low Gear has been omitted). Reverse is engaged in the usual manner by shifting the mainshaft sliding gear to the rear so that it meshes with the reverse idler gear. Gearshift lever on steering column has two forward positions—Low (corresponding to conventional 'Second Gear' position) and High—in addition to the usual Reverse position. Each of these lever positions furnishes two gear ratios as follows: Low—**1st.** (Overdrive inoperative), **2nd.** (overdrive operating); High—**3rd.** (Overdrive inoperative), **4th.** (overdrive operating).

OPERATION:—Manual Control—Steering column gearshift lever operates a conventional blocker type synchronizing clutch. With the gearshift lever in 'Low', the synchronizer unit is shifted backward on the mainshaft to engage the intermediate constant mesh gear so that the drive is transmitted through the countergears. When the gearshift lever is moved to the 'High' position, the synchronizer unit is shifted forward to engage the clutch teeth on the clutch shaft main drive gear so that the engine drives straight through without gear reduction (corresponding to the conventional High Gear). Each of these drives is modified by the Overdrive Unit to provide additional gear ratios as follows:

Automatic Overdrive Control:—Overdrive unit is of the conventional 'centrifugal pawl' engagement type and cuts in at approximately 21-25 MPH (if accelerator pedal is released momentarily) to secure 2nd. Speed (with manual control in 'Low'), 4th. Speed (with manual control in 'High'). Overdrive unit has electrical 'kick-down' control (similar to type used on 1940 Chrysler models) so that transmission can be shifted down automatically from 4th. to 3rd. or from 2nd. to 1st. by depressing the accelerator pedal beyond the wide open throttle position.

Lockout Control Button:—'OD' button on left of steering column can be pulled out to lock out 2nd & 4th speeds (car will operate in 1st or 3rd depending on gearshift lever position).

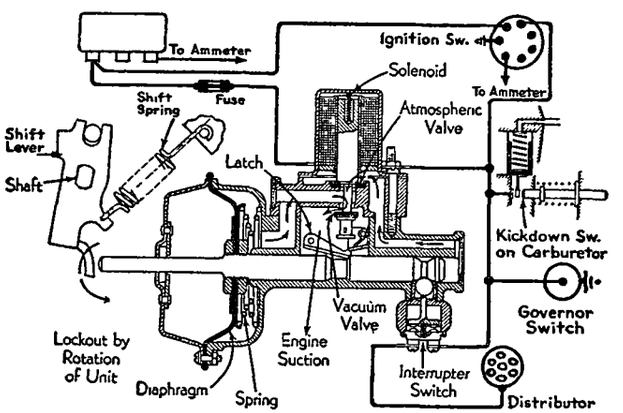
CAUTION—Pull out button only when car standing still. Button can be pushed in at any speed under 27 MPH with clutch disengaged.

ADJUSTMENT:—Throttle Switch Setting—3/32" gap between plunger and contact screw with throttle just wide open (over-travel closes switch contacts).

SERVICING:—Transmission—Serviced in same manner as Std. Chrysler Transmission (see preceding article). When disassembling this transmission, take out capscrews holding overdrive and adapter plate on transmission case, remove overdrive and adapter as an assembly by withdrawing mainshaft from rear of transmission case (adapter fastened to overdrive by screws which will prevent overdrive case separating).

Overdrive Unit:—Overdrive is Warner Type AS1-R7B. Refer to separate article on 'Warner Overdrive' for complete servicing data.

CHRYSLER 6 VACAMATIC TYPE
DE SOTO SIMPLIMATIC TYPE



Optl. Equipment On:

CHRYSLER, C28 ROYAL & WINDSOR (1941)

DE SOTO, S8 DE LUXE & CUSTOM (1941)

IMPORTANT NOTE:—Lockout Control button at left of steering column should be used only when it is necessary to start the car by pushing or towing. **Button should never be pulled out at any other time, and must be released (pushed in fully) as soon as engine starts.** To start the engine by pushing or towing car, proceed as follows: Turn on ignition, place gearshift lever in 'High Speed' position, pull out lockout control button at left of steering column, hold lever in this position until engine starts. Disengage clutch, push or tow car with clutch disengaged, when car speed reaches 5 MPH., engage clutch. **Release lockout control button as soon as engine starts.**

SPECIAL SERVICE NOTES:—Interrupter Switch Insulator—To correct complaints of mud and water from road splashing on transmission control interrupter switch which will cut out ignition and cause car to stop, special Interrupter Switch Insulator, No. 870833, can be installed on switch (switch located on underside of vacuum unit assembly at left of transmission).

TYPE:—This type transmission (Vacamatic—Chrysler 6, Simplimatic—De Soto) is used in conjunction with Fluid Drive. Transmission is entirely new design 4-speed type with a two range manual control (Low-High) and an automatic two speed shift (vacuum and spring operated with accelerator pedal control) within each range (First & Second in Low range, Third & Fourth or Direct in High range). Transmission shifts up from First to Second (above 8 MPH. with gearshift lever in Low range) or from Third to Fourth (above 15 MPH. with gearshift lever in High range) when the accelerator pedal is released momentarily. A step-down or 'kick-down' feature is provided by which a shift from Fourth to Third (at speeds below 53 MPH.), or from Second to First (at speeds below 27 MPH.) occurs automatically when the accelerator pedal is depressed past the wide open throttle position. The manual control (gearshift lever shift between Low-High) operates in exactly the same manner as the Second-High shift on previous transmission. The automatic control is entirely new and operation is described below.

OPERATION: — Manual Control — Gearshift lever has three positions corresponding to previous designs with Low Speed omitted (Low Range secured with lever in customary 'Second' position). This lever controls a conventional synchronizer clutch unit on the mainshaft which locks the Low Speed Gear to the shaft (rear position—Low Range) or the Intermediate Gear to the shaft (forward position—High Range). The two speeds in each range are controlled by the automatic synchro-clutch as follows:

Automatic Control:—Consists of a vacuum and spring operated synchro-clutch which locks the mainshaft intermediate gear to the clutch shaft drive gear (for Second and Fourth or Direct Drive with synchro-clutch in forward position). With the synchro-clutch in the rear position, intermediate gear is free to revolve on mainshaft (for First or Low Gear in which drive is transmitted through Low Speed Gear on mainshaft meshing with gear on countergear cluster), or drives mainshaft (for Third Gear when manual synchronizer unit is in forward position). The synchro-clutch shift lever is spring-loaded so that it is in the forward position (Second & Fourth) except when the vacuum unit assembly operates to shift the synchro-clutch to the rear position (First & Third). This vacuum unit assembly operates as follows:

Vacuum Unit Assembly:—Consists of a diaphragm type vacuum unit with solenoid operated valve mounted on a pivot on the side of the transmission case so that the vacuum unit plunger stem operates the synchro-clutch shift lever. With the solenoid not energized, valve is in lower position so that diaphragm chamber is connected to vacuum source (engine manifold). Vacuum causes plunger to move fully to the right until the latch under the solenoid valve engages the notch in the plunger stem holding the plunger in this position with the vacuum diaphragm spring fully compressed (this action permits shift lever spring to move synchro-clutch to forward position). Whenever the solenoid is energized (by the Governor Switch, Carburetor Kickdown Switch or Ignition Switch when turned 'off' as described below), the valve is drawn up, cutting off the vacuum and opening the atmospheric valve so that air is admitted to the diaphragm chamber. This movement of the valve stem also releases the plunger stem latch so that the plunger is free to move to the left to shift the synchro-clutch to the rear position. As the plunger moves to the left, the ridge on the end of the plunger stem rides over the ball of the interrupter switch, closing the switch contacts and cutting out the ignition momentarily, which relieves the torque on the synchro-clutch and allows it to be shifted. As soon as the plunger ridge passes the interrupter switch ball, the switch contacts are opened by a spring and the ignition is restored (this entire action occurs so rapidly that the interruption of the ignition is not apparent).

Control Circuit & Switches:—The vacuum unit solenoid valve is connected through a 30 ampere fuse to a special terminal of the ignition switch and to the control relay so that the solenoid circuit is 'hot' at all times when the ignition switch is turned on and when the generator is rotating above the cut-in speed. The solenoid is energized (to operate the vacuum unit) whenever the solenoid circuit is completed to ground in any one of the various ways:

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Control Relay—Consists of a relay with single winding (similar to horn relay) connected so that the solenoid circuit is completed with relay contacts closed. Relay winding is connected to generator main brush terminal on regulator so that contacts close as soon as generator begins to charge

Governor Switch—Governor switch contacts are closed (so that solenoid is energized) with the car at rest. As the car speed increases, the governor weights move out and open the switch contacts which breaks the solenoid circuit. Governor switch is driven by a special gear of the countergear cluster so that the cut-in and cut-out speeds are approximately twice as high in the 'High' range as in the 'Low' range.

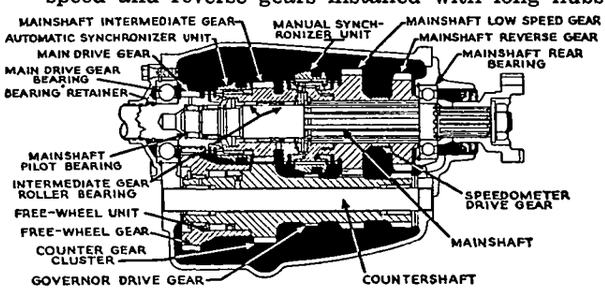
Carburetor 'Kick-down' Switch—Consists of a stationary contact connected to the solenoid and a movable contact mounted on a vacuum controlled piston in the carburetor. A switch plunger operated by the throttle valve lever completes the circuit to ground (so that solenoid is energized) when the accelerator is depressed past the wide open throttle position at car speeds under 27 MPH. (low range for kick-down to First), 53 MPH. (High range for kick-down to Third). Above the speeds, vacuum in carburetor pulls the piston and ground contact up against spring tension so that the plunger does not complete the circuit to ground.

Ignition Switch Ground—A special terminal and ground connection in the ignition switch completes the solenoid circuit to ground whenever the ignition switch is turned off.

Ignition Interrupter Switch—This switch does not ground the solenoid circuit but does ground the ignition primary (short-circuiting the breaker contacts) when the switch contacts are closed (this occurs only momentarily during the vacuum unit plunger movement) to permit the synchro-clutch to be shifted.

CHECKING & ADJUSTMENT: — Vacuum Unit — Clearance between end of vacuum unit stem and shift lever must be 5/32" with vacuum unit in latched position. To adjust, make certain that vacuum unit in latched position and that lockout button is all the way in with vacuum unit against stop on mounting bracket, see that synchro-clutch is in engaged position (spring will engage synchro-clutch if clutch driving plate rocked by hand through fluid drive filler plug hole in clutch housing with engine at rest). Loosen jam nut on shift shaft, loosen locknut and turn adjusting screw on shift shaft until clearance between lever and vacuum unit stem is 5/32", tighten locknut and jam nut (see that lever does not move when jam nut tightened).

Kick-down Switch—Check switch by connecting test light to battery and to switch terminal. Fully depress accelerator pedal. Lamp should light. If lamp does not light, disassemble and examine switch. If lamp lights but solenoid is not energized, replace solenoid.



Governor Switch—To check operation, accelerate engine past 1100 RPM (clutch engaged). If vacuum unit does not latch, remove governor wire and repeat test. If vacuum unit latches with wire removed, replace governor switch. If vacuum unit does not latch with wire removed, remove fuse. If vacuum unit latches with fuse removed, check wiring for grounds, check vacuum unit for binding or other mechanical trouble.

Carburetor Slow-closing Throttle — See Slow-closing throttle article in Carburetion Equipment Section for description of two different types used and adjustment directions.

Fuse—30 ampere. In solenoid lead.

SERVICING:—Disassembly—Remove clevis pin and lift off vacuum unit, unscrew and remove governor, remove speedometer pinion. Lock transmission in reverse, shift synchro-clutch sleeve to forward position to lock gears. Remove companion flange nut, take off brake drum, pull oil seal with special puller C-497, remove detent ball retaining screws and spring in gearshift housing. Place gearshift levers in neutral, remove gearshift housing. Remove capscrews in brake support, turn support counter-clockwise to expose shift rail holes, remove shifting fork and reverse idler shaft retaining screws, slide shift rails out through rear of case (top rail first —use care not to lose detent balls and spacer on lower reverse rail), remove reverse fork. Take off drive pinion bearing, retainer, remove main shift fork guide pin (unscrew pin and pull out at front of case), remove manual shift fork. Use puller C-604 to remove reverse idler shaft through rear of case, lift out reverse idler gear. Use special C-605 arbor to drive countershaft out through rear of case and allow countergears to drop down in case. Pull mainshaft and gear assembly out through rear of case, remove drive pinion and synchro-clutch sleeve, lift out countergear assembly. Remove shifter rail selector plug (remove cupped plug in top of vertical hole in case).

Mainshaft Gear Assembly:—Remove blocker ring on forward end of shaft, remove synchro-clutch spreader ring, remove intermediate gear snap ring, remove gear being careful not to lose roller bearings, bronze thrust washer, and roller bearing thrust washer. Remove gear stop ring, thrust washer, clutch sleeve, and shifting plates (synchronizer assembly). Remove brake support housing by tapping rear end of shaft with a lead hammer. Remaining gears can be pressed of shaft in an arbor press or removed with a gear puller. When assembling shaft, use new snap rings, see that low speed and reverse gears installed with long hubs

toward rear. Endplay between low speed gear and speedometer drive gear should be .003-.009" with feeler gauge inserted between shoulders of gears (spacers furnished .041", .045", .050", .055" thick for this adjustment). When installing intermediate (third speed) gear, install 36 rollers in forward end, then install spacer with holes and groove toward rear so that oil holes line up (this is important), then install 36 rollers in rear end, small steel thrust washer next to rollers and bronze thrust washer, then install assembly on shaft (use cup grease to hold rollers in place). Install forward bronze thrust washer with oil groove to rear, steel thrust washer with tapered face to front, use new snap ring. Endplay between steel thrust washer and snap ring should be .003-.009" (adjust by using snap ring of correct thickness—furnished .087", .092", .097", .101" thick).

Automatic Control Synchro-clutch:—When assembling, make certain that teeth on clutch hub mesh with center space of each set of teeth on clutch sleeve (CAUTION—clutch sleeve cannot be shifted unless meshed in this manner). With two capscrews installed in brake support to align mainshaft assembly, install spreader ring and synchro-clutch blocker ring, see that clutch sleeve can be pulled all the way over the dogs of the blocker ring.

Countergear Assembly:—To dismantle free-wheeling gear, remove snap ring in end of cluster gear, remove thrust washer, free-wheeling gear, thrust washer and roller bearings, free-wheeling rollers, roller cage and springs (use care not to lose two springs under the cage). Reassemble in same manner using cup grease to retain free-wheeling rollers, install roller thrust washer with beveled side toward rollers, turn roller cage clockwise and install free-wheeling gear. Install the 36 rollers in forward end of cluster gear for free-wheeling gear (use cup grease to hold rollers in place), install retainer washer and new snap ring. Measure endplay between free-wheeling gear and cluster gear (use feeler stock) which should be .003-.009". Adjust by installing thrust washer of correct thickness (furnished .084", .087", .091" thick).

FORD—LINCOLN—MERCURY TYPES

Used On:

FORD, PASS. CAR & COMM'L. MODELS (1941)
FORD TRUCK, ¾ & 1 TON MODELS (1941)
LINCOLN, ZEPHYR & CONTINENTAL 16 H (1941)
LINCOLN, CUSTOM MODEL 168H (1941)
MERCURY, MODEL 19A (1941)

NOTE:—Four speed transmission is standard on other truck models and optional on these ¾ and 1 Ton

Lincoln Models—Warner Overdrive, Type AS1-R10, optional on all models. See separate article on Warner (Lincoln) Overdrive for complete servicing and adjustment data.

TYPE:—Constant-mesh, synchro-mesh (Second and High), sliding gear (Low and Reverse), all-helical gear type. Same design as used on corresponding 1940 car models.

SERVICING:—Disassembly—Remove transmission cover and shifter assembly. Take out capscrew in rear end of shaft, remove universal joint yoke. Remove screws mounting universal joint housing on rear of case, remove housing. Remove locking pin retaining countershaft and reverse idler shaft, withdraw countershaft. Take out bearing retaining screws on front of case, remove main drive gear and bearing assembly. Remove mainshaft rear bearing, remove mainshaft (synchronizer unit and gears can be removed from forward end of shaft after snap ring removed from groove in shaft directly forward of synchronizer inner clutch sleeve).

Synchronizer Assembly:—To remove synchronizer unit and second speed gear from mainshaft, take out retaining snap ring in groove in shaft in front of synchronizer inner clutch sleeve, slide synchronizer assembly off shaft, remove hub spacer and second speed gear.

Synchronizer Unit—Inner and outer clutch sleeves marked by etched line to insure reassembly in same position. If unit being dismantled, use extreme care not to lose poppet balls and springs (3 each) which will spring out when outer sleeve removed. When

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

reassembling unit, place struts in slots in inner sleeve, install springs and balls in holes in struts and sleeve, install outer sleeve (lining up marks on inner and outer sleeves), see that synchronizer ring notches engage ends of struts. Backlash between inner and outer clutch sleeves should be .000-.001". Synchronizer unit is mounted on shaft by same snap ring used to retain second speed gear.

NOTE—This type synchronizer can be distinguished from wire-bound blocking type synchronizer used on previous models by absence of shoulder on second speed end of outer clutch sleeve.

Second Speed Gear—Gear bushing not furnished separately. When installing gear on shaft, select hub spacer of correct thickness so that gear endplay (with synchronizer in place and snap ring installed) is .004-.008". This hub spacer furnished in two thicknesses—81A-7069-A (.0655-.0665"), and 81A-7069-B (.0705-.0715").

Gearshift Assembly:—To dismantle gearshift assembly, remove lockrings on shifter shaft ends of forks, remove forks from shifter shafts. Drive out locking pins in levers at outer ends of shifter shafts, withdraw shafts from inside of cover using extreme care not to lose detent balls, spring, and plunger. Reassemble shifter mechanism in same manner. See that oil seal in recess in cover at outer end of each shifter shaft is in good condition. See Ford & Lincoln Transmission Control articles for adjustment directions when transmission installed on car.

FORD FOUR-SPEED TRUCK TYPE

Used On:

FORD TRUCKS, ALL MODELS EXCEPT ¾ & 1 TON
OPTIONAL ON ¾ & 1 TON MODELS (1941)

TYPE:—Four speed, sliding spur gear type. Same design as used on 1940 models with Hotchkiss drive and propeller shaft mounted hand brake.

Hand Brake—Brake drum mounted on front universal joint companion flange with brake band mounting brackets and linkage mounted on transmission case.

SERVICING:—***Refer to Ford Four Speed Truck Type Transmission article in Mechanical Equipment Section of manual for complete data.***

HUDSON TYPE

Used On:

SIX, MODELS 10, 11, 12, 18 (1941)
EIGHT, MODELS 14, 15, 17 (1941)

NOTE:—**Overdrive Transmission** — Overdrive Transmission is optional on all models. Overdrive unit is Warner Type AS1-R9B and is used in conjunction with a Hudson transmission for which data is given below. ***Refer to Warner Electrical Type Overdrive article for complete servicing and adjustment data on overdrive.***

Transmission Controls—Steering column mounted gearshift is standard on all models. ***Refer to separate Hudson Transmission Control article for adjustment and servicing data.***

TYPE:—New design, constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse), all-helical gear type. Main drive gear is integral with clutch shaft and is mounted on ball bearing in front of case. Mainshaft is mounted on roller bearing in main drive gear hub (front), ball bearing in rear of case or in adapter plate on overdrive models (rear). Countergear cluster is mounted on bushings on stationary countershaft with thrust washers at each end. Second speed gear is retained on mainshaft as an assembly with the synchronizer unit by a snap ring installed in a groove in the shaft directly in front of the synchronizer inner clutch sleeve.

Synchronizer Unit — Double-blocker, double-spring type. Synchronizer rings are free in ends of inner clutch sleeve and are actuated by three shifting plates or struts which fit in slots in inner clutch sleeve and engage notches in rings. Struts are centered in outer clutch sleeve by two wire springs (within struts on each side of inner clutch web) and move with outer clutch sleeve to engage with cones on gear hubs for synchronization. Teeth on rings block or prevent gear engagement until synchronization completed. Inner clutch sleeve is stationary on shaft and does not move (retained with second speed gear by snap ring in groove in shaft).

SERVICING:—**Disassembly Note** — On models with overdrive, overdrive unit can be disassembled and serviced without disturbing transmission providing that adapter plate is not disturbed (must not be allowed to separate from transmission case). Refer to Warner Electrical Type Overdrive article for complete servicing data.

Transmission Disassembly:—On models with Automatic Clutch, unscrew Governor Switch from housing. Remove transmission cover screws, lift cover off carefully to prevent detent ball spring flying out, tilt transmission case to one side and remove spring and detent ball. Remove front universal joint companion flange nut, lockwasher, plain washer. Use puller J-820 to remove companion flange. Take out screws in speedometer gear housing (rear bearing retainer), remove housing and speedometer gear using care not to damage oil seal in housing. Remove low & reverse shift fork lockscrew and shifter lockscrew, slide low & reverse shift rail out through front of case, remove shift fork and reverse shifter from case. Tilt case and remove interlock plunger from hole in side of case. Remove second & high shift fork lockscrew, slide shift rail out, lift fork out of case, tilt case and remove detent ball and spring. Slide mainshaft and gear assembly back so that rear bearing is free of case, tilt front end of shaft up, remove snap ring in shaft directly in front of synchronizer inner clutch sleeve (use special pliers J-1575). Slide synchronizer unit, second speed gear, low speed gear, off shaft and remove through top of case, then withdraw mainshaft and bearing through rear of case. Remove countershaft lockplate screw on rear of case, drive out plate with a drift, drive countershaft out through rear of case using Driver J-1574, remove countergear cluster and thrust washers. Pull main drive gear out through front of case (use driver J-1574 if necessary—gear will be free with clutch housing and bearing retainer removed). Use driver J-1574 inserted through main drive gear bearing hole to drive out reverse idler gear shaft, lift reverse gear out.

Reassembly—Reassemble transmission in same manner and note following points: Install low speed gear on mainshaft with shift fork flange toward front and make certain that four oil holes in flange groove line up with grooves in shaft. Install second speed gear with tapered side of hub toward front, install synchronizer unit with tapered side of shift sleeve toward front, select lock ring of correct thickness (furnished .087", .090", .093", .097" thick) so that synchronizer has no appreciable endplay when lock ring installed. See that detent balls and springs correctly installed (low & reverse spring at top is heavier than second & high spring at bottom and springs must not be interchanged).

Mainshaft & Rear Bearing Assembly:—Use special puller J-1134 to remove bearing from shaft. When installing bearing, see that locking ring on bearing is toward rear of shaft, use replacer tool J-1570 to drive bearing in place.

Main Drive Gear & Bearing Assembly:—To remove bearing, remove lock ring in groove in shaft with J1575 pliers, use puller J-1134-H to remove bearing from shaft (bearing will be damaged if driven off). When installing bearing, see that shielded side is toward gear (to rear when installed), use replacer tool J-1570 to drive bearing in place. Select lock ring of correct thickness (furnished in thicknesses of .090", .093", .096") so that lock ring is snug fit in groove and there is no appreciable endplay. Use grease to retain mainshaft bearing rollers in drive gear hub until mainshaft installed. If oil seal in bearing retainer being replaced, use remover J-1576 to tap old seal out, press new seal in place with J-1569 seal replacer tool. Use new gasket when installing retainer on case. NOTE—Retainer locating pin engages hole in clutch housing so that retainer can only be installed with throw-out bearing oil holes lined up properly.

Synchronizer Unit:—If synchronizer unit being dismantled, mark inner and outer clutch sleeves and rings to insure reassembly in same positions. Install struts with open face toward inner clutch sleeve, install springs with hooked end of each spring in same strut with free ends running in opposite directions. See that undercut on inner sleeve points toward rear of transmission and install synchronizer on mainshaft with tapered side of outer sleeve toward front.

IMPORTANT NOTE—Two types of synchronizer rings and sleeves used in production and must not be interchanged. Rings with 110° chamfer on face of teeth are marked '110' on flange face and must be used with 110° clutch sleeves which are marked by groove on outside face. 90° chamfer rings and sleeves not marked. CAUTION—90° parts must not be used with 110° parts.

Countergear Assembly:—Countergear bushings can be renewed by using J-1573 puller to remove old bushings, J-1572 replacer to install new bushings, and then reaming bushing with KMO-338 bushing reamer (pilot reamer on guide installed in other end of gear cluster while reaming each bushing). When installing countergears in transmission, coat bronze thrust washers with chassis lubricant, install washers in case so that they engage retaining pins in case, install steel thrust washer between gear cluster and rear thrust washer. See that both countershaft and reverse idler shaft are locked in place by lockplate and that lockplate screw tightened securely.

Shifter Shafts & Levers:—Selector shaft can be removed from within case after taking off nut, washers, and lever on outer end of shaft. Bushing is withdrawn from outside after bushing setscrew has been loosened. When removing shift shaft, first punchmark inner lever and shaft to insure correct reassembly (if position lost, use indexing tool J-1571 to re-install inner lever). Remove nut on outer end of shaft, remove lever. Drive out pin in shaft boss on side of case, remove inner lever, withdraw shaft and felt seal. Install levers in same manner.

NASH 4160, 4180 TYPE

Used On:

AMBASSADOR SIX, MODEL 4160 (1941)
AMBASSADOR EIGHT, MODEL 4180 (1941)

NOTE:—Overdrive Transmission—Overdrive or Cruising Gear transmission is Optional on all models. Overdrive unit is Warner Type AS1-R7C and is used in conjunction with a Nash type transmission for which data is given below. ***Refer to Warner Overdrive article for complete servicing and adjustment data.***

Nash 4140 Model — This model equipped with Warner Type AS3-T84G (Std.), AS4-T84G (Optl. with Overdrive). ***Refer to Warner Transmission articles for data on this model.***

TYPE: — New design, constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse), all-helical gear type. Main drive gear is integral with clutch gear shaft and is mounted on ball bearing in front of transmission case. Mainshaft is mounted on roller bearing in main drive gear (front), ball bearing in retainer cap on case (rear). Countergear cluster is mounted on roller bearings on stationary shaft with thrust washers at each end. Second speed gear is retained on mainshaft as an assembly with the synchronizer unit by a splined locking washer retained by a spring-loaded lock plunger installed in the shaft directly in front of the synchronizer inner hub.

Synchronizer Unit — Double-blocker, double-spring type. Synchronizer rings are free in ends of inner clutch sleeve and are actuated by three shifting plates or struts which fit in slots in inner clutch sleeve and engage notches in synchronizer rings. Struts are centered in outer clutch sleeve by two wire springs (within struts on either side of inner clutch web) and move with outer clutch sleeve to engage with cones on gear hubs for synchronization. Teeth on rings block or prevent gear engagement until synchronization completed. Inner clutch sleeve is stationary on mainshaft and does not move (retained with second speed gear by locking washer and plunger on forward end).

SERVICING:—Disassembly Note — On models with Overdrive, overdrive unit can be disassembled and serviced without disturbing transmission. Refer to Warner Overdrive article for complete data.

Transmission Disassembly:—Drive both shift shaft bushing retaining pins out of shift shaft bosses in case toward top. Remove expansion plugs in left front and rear of transmission case, use J-1600 speed finder plunger tool to prevent detent plungers dropping out, work shift shafts out of case as far as possible, remove detent plungers and spring, remove shift forks through top of case. Use special countershaft assembly tool J-1415A (dummy shaft or arbor) to drive countershaft out at front of case and leaving tool within case so that counter-gear cluster drops down on small diameter of tool. Remove capscrews and nuts retaining rear bearing retainer cap (or adapter plate on overdrive transmissions), withdraw mainshaft and gears through rear of case as an assembly (CAUTION—On overdrive models, use extreme care that adapter plate does not separate from overdrive case which would require dismantling of overdrive to reassemble freewheel rollers—install one screw to hold adapter plate and overdrive case together while off transmission). To remove main drive gear, take out screws in bearing retainer on front of case, withdraw drive gear and bearing as an assembly. Shifter shafts can then be removed through top of case by removing levers on outer ends of shafts and pushing shafts through into case.

Reassembly—Reassemble transmission in same manner paying particular attention to following points:

Mainshaft Endplay—Controlled by thickness of shims between rear of transmission case and rear main bearing cap or overdrive adapter. With transmission assembled, install shift collar centering gauge tool J-1410 (.070" thick) between front face of high speed synchronizer ring and rear face of main drive gear. If gauge is tight, add additional shims at rear bearing cap so that clearance at gauge is from 0 to .015" maximum.

Speed Finder Locating Screw—Located on side of transmission case between shifter shafts. Need not be disturbed to remove detent plungers but if removed, screw should be adjusted so that inner end engages flattened portion of plungers to prevent plungers turning but must not cause plungers to bind. Lock adjustment with locknut.

Shifter Shafts—When installing shift shaft forks, see that low and reverse fork installed with longer segment at top. Cork oil seals and retainers are installed on outer ends of shafts and shaft bushing retaining pins should be installed from the top.

Synchronizer & Second Speed Gear:—To dismantle assembly, depress locking plunger under lock ring in front of synchronizer inner clutch sleeve with a sharp pointed tool, revolve lock ring one spline so that it is free and withdraw from shaft, remove synchronizer units, thrust washer, second speed gear, thrust washer. Low speed gear can then also be removed from shaft. Install assembly in same manner selecting retainer washer of correct thickness so that second gear endplay is .004-.006" with retainer installed. See that retainer turned so that it is locked in place in mainshaft splines and that locking plunger prevents retainer from turning.

Synchronizer Unit—Inner and outer clutch sleeves and rings should be marked before disassembly to insure reassembly in same positions. Install struts with open face toward inner clutch sleeve and hooked end of each spring wire engaged in the same strut (free end of this spring will be between this strut and next strut in clockwise direction).

Main Drive Gear & Bearing:—Bearing retained on shaft by snap ring in groove in shaft (plain washer between snap ring and bearing) and retained in case by snap ring in groove in bearing (this snap ring retained by bearing retainer when it is bolted on case). When installing bearing, use thickest possible snap ring (furnished in various thicknesses) so that bearing is a tight assembly. When installing bearing retainer cap, see that notch in gasket lines up with oil holes in case.

Countergear Assembly:—When installing countergear cluster, install thrust washer at each end with tongue in line with slot in case (washers may be held by grease while installing gears. Allow gears to hang down on small diameter of tool J-1415-A while main drive gear and mainshaft are being assembled then push out tool by inserting countershaft from end of case being careful not to damage thrust washers.

PACKARD TYPE

Used On:

CLIPPER MODEL 1951 (1941)
'110' Six 1900, '120' EIGHT 1901,1A ('41)
'160' SUPER 8 1903,3A,4,5; '180' 1906,7,8 ('41)

OVERDRIVE TRANSMISSION NOTE:—Econo-drive or Aero-drive (Overdrive) Optl. on all models. Overdrive unit is Warner Type R9 (Six, Eight, Clipper), R9A (Super 8) and is used in conjunction with a Packard type transmission. ***Refer to Warner Electrical Type Overdrive for complete Overdrive and Control servicing and adjustment data.***

SERVICING:—Overdrive Transmission Note—Transmissions with overdrive can be disassembled without disturbing overdrive unit as follows: Remove overdrive drain plug (on lower rear end of case), transmission cover and shifter mechanism, main drive gear bearing retainer (on front of transmission case). Insert special ST-5043 roller bearing assembly bar through overdrive drain plug hole and hole in front end of case, drive countershaft out through front end of transmission case leaving the assembly bar in the counter gear cluster to retain the bearings until the gear cluster is removed. Take out two short capscrews holding adapter plate to transmission case (do not disturb screws bolting overdrive case to adapter). Remove main drive gear and bearing through front of case, slide synchronizer assembly off front end of mainshaft. Withdraw overdrive unit, adapter plate, and mainshaft assembly from rear end of transmission case as a unit. CAUTION—Do not permit adapter plate to separate from overdrive case which will require complete disassembly of overdrive.

Transmission Disassembly (Without Overdrive):—Remove transmission case cover and shifter mechanism, take off nut on rear end of shaft, pull universal joint flange, take out screws and remove rear bearing cap, remove countershaft lock plate, remove main drive gear bearing retainer on front of case. Use ST-5043 roller bearing assembly bar as a drift and drive countershaft out through front of case (leave bar in counter gear cluster to retain bearing rollers). Remove main drive gear and bearing through front of case. Move mainshaft and gear assembly to rear until rear bearing clears case, tap bearing off shaft, then remove mainshaft assembly through top of case. Lift out counter gear cluster, thrust washers, and bearing rollers. To remove reverse idler gear, drive shaft out toward rear.

Synchronizer Unit:—Conventional poppet ball and spring type. Unit can be dismantled by sliding outer clutch sleeve off inner sleeve using extreme care not to lose poppet balls and springs which will fly out (mark inner and outer sleeves and replace in same position). Use band type ring compressor or ST-5014 clamp to re-install balls and springs.

Synchronizer Travel Adjustment—Check clearance between lug on second-high shifter fork and stop on cover with shift lever in High Gear position. Clearance should be .005" min., .010" max. Adjust by bending lug. CAUTION—If clearance greater than .010", outer clutch sleeve may move too far forward which will allow synchronizer balls and springs to fly out. If this occurs, cover must be removed and synchronizer reassembled.

Mainshaft, Low & Second Speed Gear Assembly:—Both low and second speed gears are furnished as an assembly with the mainshaft and should not be removed. These gears are constant-mesh type and are mounted on double row ball bearings on shaft.

DETROIT 4100, 4200 SERIES

SERIES 4100

Bantam Super Four, Model 65 (1941)
Willys, Americar & Plainsman 441 (1941)
Willys, Pick-Up 441, Panel Del. 441P (1941)

SERIES 4200

①Dodge, Model D19 (1941)
①Plymouth, Models P11, P12 (1941)

①—Series 7200 universals used on 7 pass. Sedans.

DESCRIPTION:—Ball and Trunnion type with Roller Bearings. Same design as used on 1940 car models except as follows:

Dodge & Plymouth Rear Universal Boot—A new synthetic rubber boot (not affected by heat, cold, oil or water) with an inner cone formed at housing end is used in place of leather boot to exclude dirt. NOTE—Rubber boot can be used for replacement only if shaft disassembled.

DISCONNECTING UNIVERSAL:—Take out bolts which mount housing to companion flange. Do not disturb cover clipped to housing flange (cover has notation 'Do not remove cover') unless joint is to be disassembled.

SERVICING:—**Disassembly**—Bend back three lugs only on one side of grease cover, slide cover off sideways, push housing back on shaft, remove centering buttons and balls (CAUTION—do not lose roller bearings out of balls). Wash all parts and inspect for wear. If balls or rollers show wear, replace with complete ball and roller assembly. Check housing, raceways for ball impressions which result in backlash, replace housing if unduly worn. Press out pin in ballhead only if pin or housing is to be replaced.

Assembling—First slip housing over ballhead, press pin in place **being sure that equal amount of pin extends through each side of ball head**—THIS IS IMPORTANT. Place 1/16" washers over ends of pin, install ball & roller assemblies, then install centering buttons with 1/64" spring washers next to pin ends. Pull housing forward to hold parts in place. Apply 1¼ ozs. of fibre grease across face of balls. Install conical spring, being certain that small end of spring rests over pilot on end of ballhead, new gasket, and grease cover, bend down lugs on grease cover. IMPORTANT—When connecting universal, use new lockwashers and **tighten nuts holding universal to companion flange securely.**

UNIVERSAL JOINT BOOTS:—Original equipment boot is seamless leather type (see Dodge & Plymouth Note above) with a cone extending into housing and secured by a clamp on each end. To remove boot, remove clamps and cut off old boot (CAUTION—When removing boot use care not to disturb cone), leave cone in place and install new service boot which is hook-on type and can be installed without removing shaft from car, press metal hooks down tight to close longtitudinal seam and twist wires tight on each end. NOTE—If cone destroyed, install special combination service cone and boot.

DETROIT 4251 SERIES

Used On:

Packard '110' Six, Model 1900 (1941)
Packard Six Taxi, Model T-1900 (1941)

DESCRIPTION:—Roller bearing type. Transmission end equipped with Series 4200 universal (see preceding article for data). Axle end equipped with Series 5150 universal, consisting of conventional cross with individual bearings on cross trunnions. One pair of bearings is pressed into propeller shaft yoke ends and retained by locking rings on inner face of yoke. Other pair of bearings engage half holes in companion flange and are secured by locking rings on inner face of companion flange. Two bolts pass through two U-shaped clamps and companion flange to secure assembly.

DISCONNECTING UNIVERSAL:—Remove two bolts and U-clamp to free assembly from companion flange, taking care not to drop the two free bearings. CAUTION—On Packard models, rear universal flange nut controls rear axle pinion shaft bearings pre-load. Refer to Mechanical Equipment Index for Packard Rear Axle article for complete data.

SERVICING:—**Disassembly**—With U-clamp removed, one pair of bearings will slide off cross trunnion, locking rings remain permanently on these two bearings. Press out other two bearings after removing locking rings.

Servicing—Thoroughly clean all parts. Examine for wear and replace worn or damaged parts. Clean out lubricant holes in ends of cross trunnion, repack holes and bearings with approved lubricant.

Assembling—Reverse disassembly directions

DETROIT 7200, 7300 SERIES

SERIES 7200

Chrysler, Royal & Windsor C28 (1941)
DeSoto, Dodge, Plymouth 7 Pass. only ('41)

SERIES 7300

Chrysler Eight, C30, C33 (1941)

DESCRIPTION:—Cross and roller bearing type. Same design as used on 1940 car models.

DISCONNECTING UNIVERSAL:—Bearing blocks attached to companion flange by screws. Take out screws and lockwashers in blocks to free shaft.

SERVICING:—**Disassembly**—Remove tie spring holding bearing blocks on cross. Remove bearing blocks, dust seals and retainers. Take out locking rings from bearing cups in yoke. Tap on outer end of one bearing cup to start opposite cup out, withdraw bearing cup, tap on end of cross to start opposite bearing cup. Remove dust seals and retainers.

Servicing—Thoroughly clean all parts. Examine for wear and replace all worn or damaged parts. Clean out lubricant holes in cross, repack entire assembly with correct type lubricant.

Assembling—Use new dust seals. Reverse disassembly data above. When shaft installed, arrow on shaft and yoke must be in alignment.

MECHANICS 2C, 3C TYPES

TYPE 2C

①Oldsmobile, Model 66,68,76,78,96,98 ('41)
①Pontiac, Models 41-24,25,26,27,28,29 ('41)

TYPE 3C

Cadillac, Models 41-60S,61,62,63,67,75 (1941)
②Packard Eight & Super 8, 1901A,3A,5,8 (1941)

①—Mechanics Type 2CR also used on some cars.
②—Used on front shaft only, Type 3CR on rear.

DESCRIPTION:—Roller bearing type with conventional cross. Same design as used on 1940 car models.

DISCONNECTING UNIVERSAL:—Turn down locks and take out two capscrews in opposite trunnion bearings on companion flange, wire trunnions together to prevent them coming off ends of cross (unless joint is to be disassembled), tap trunnions lightly with soft hammer to disengage drive lugs (lugs on trunnion bearing engage slot in flange and flange end is turned up to retain trunnions). NOTE—This data applies to Wing type trunnion bearings only. Wing type trunnion bearings used at rear universal only on Oldsmobile & Pontiac and shaft can be removed on these cars by disconnecting rear universal and pulling shaft free of slip joint at transmission. See Disassembly directions below for servicing Round Type trunnions.

SERVICING:—**Disassembly**—Wing type trunnion bearings may be pulled directly off universal joint cross after mounting capscrews have been removed (do not lose loose rollers in bearing). To remove Round type trunnion bearings, shaft must be removed to the bench. Clamp yoke or drive shaft tube (at weld) in vise, take out screws and remove bearing end plates (both sides). Use flat end drift slightly smaller in diameter than bearing, drive on outer end of one bearing, driving bearing in until shoulder on cross strikes inside of yoke lug. This will start opposite bearing out. Grip this bearing in vise (use brass or copper jaws) work shaft back and forth until bearing comes out. Drive other bearing out in same manner (using drift against end of cross).

Servicing—Wash all parts in gasoline. Clean out lubricant passage in cross. Replace worn parts (examine cross journal, trunnion bearing and rollers for wear), repack all space with semi-fluid chassis lubricant or SAE. #160 oil.

Assembling—Use new cork seal or packing washers. Reverse disassembling directions above. When installing Round type bearings, tap bearings in place or if arbor press used, see that pressure is not great enough to spring yoke ends. On Wing type bearings, use new lock plate and see that ears on lock plate turned up against capscrews after screws are securely tightened.

MECHANICS 1½R, 2CR, 3CR TYPES

TYPE 1½R

Nash '600', Model 4140 (1941)

TYPE 2CR

DeSoto, Model S8 (1941)—Except 7 pass.
Nash, Ambassador Six, Model 4160 (1941)
①Oldsmobile, Models 66,68,76,78,96,98 ('41)
①Pontiac, Models 41-24,25,26,27,28,29 ('41)

TYPE 3CR

Nash, Ambassador Eight, Model 4180 (1941)
Packard Clipper, Model 1951 (1941)
Packard Eight & Super 8, 1901,1A,3A,4,5,6,7,8 ('41)

①—Mechanics Type 2C also used on some cars.

DESCRIPTION:—Roller bearing type with conventional cross and individual trunnion bearings fitted on cross ends. Two types of trunnion bearings used: 1) Wing or Flanged type secured to fitting yokes by two capscrews, 2) Round type fitted into bore in yoke arms and retained by snap ring fitted in groove on bearing on inner side of yoke arms. NOTE—Round type trunnion bearings only used on Nash '600' universal joint.

DISCONNECTING UNIVERSAL:—Remove four capscrews securing wing type bearings to companion flange at each end of shaft (wire bearings to prevent them falling off) and remove shaft (NOTE—On cars with flange type bearings at rear only, pull shaft free of slip joint at transmission. NOTE—On Nash '600' rear axle assembly must be removed to expose universal.

SERVICING:—**Disassembly**—Clamp propeller shaft in vise and remove flange type bearings. To remove Round type bearings, use punch and drive out snap rings on all bearings, place cross on vise and strike yoke with hammer until bearing protrudes, repeat operation for opposite bearing, clamp protruding end of bearing in vise and strike yoke with hammer to free yoke from bearings, repeat operation until

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

all bearings removed. Remove cross from yoke.

Servicing—If parts show signs of wear, replace with a new cross and four complete bearing assemblies. Care should be taken that no dirt gets into bearings before joint assembled.

Assembling—Use new cork seals on each trunnion (check bearings for lubricant). Install bearing in one yoke with open end flush with inside of yoke fork, insert cross and assemble bearing in opposite yoke, rest assembly on one bearing and drive on opposite bearing until both bearings approximately flush with outside of yoke, insert snap rings on inner end of each bearing, strike end bearing with hammer to centralize assembly on yoke.

SPICER (FORD) TYPE

Used On:

Ford, All Passenger Cars & Comm'l (1941)
Lincoln, Zephyr & Continental 16H (1941)
Lincoln, Custom Model 168H (1941)
Mercury, Model 19A (1941)

NOTE:—Torque tube drive used with a single universal in a ball housing at rear of transmission. Housing flange mounting screws must be taken out and axle assembly pulled back to expose universal.

Ford Trucks—Hotchkiss drive used. See Spicer Needle Bearing Type universal joints for data.

DESCRIPTION:—Conventional cross with individual bearings (bushings on Ford & Mercury, roller bearings on Lincoln) on cross ends. Same design as used on 1940 models.

REMOVAL:—Rear axle ordinarily removed by pulling drive shaft out of splined joint at rear of universal after ball housing flange bolts removed (front yoke bolted on end of transmission mainshaft). Universal can be removed by using special wrench through opening in splined shaft and taking bolt out of front yoke.

SERVICING:—Disassembly. Remove lock ring from each yoke. Drive bushings or caps out with punch (do not lose needle bearings when caps removed).

Assembling—Reverse disassembly directions above (line up lock ring groove in bushing or cap and yoke, install ring). Pack needle bearings with grease before installing. When installing front yoke, see that rear bearing against shoulder on shaft and yoke shoulder against bearing. Tighten mounting screw (see that washer under screw head seated in counterbore in yoke). Fill joint with universal lubricant.

SPICER NEEDLE BEARING TYPE

Used On:

Buick, Series 41-40,50 (1941)—SEE NOTE
Chevrolet Trucks, AL; YR,S,T,U,V,W ('41) SEE NOTE
Crosley, Model CB41 (1941)—SEE NOTE
Ford, All Truck Models (1941)
Graham Hollywood, Models 109,113 (1941)
Hudson, Models 10,11,12,14,15,17,18 (1941)
Studebaker, Models 3G, 11A, 7C (1941)

NOTE:—Buick—Spicer Model 202-5 or Buick type used. For servicing data on both type universals, refer to Buick Type article following.

Chevrolet ¾ Ton AL—Chevrolet type universal used at transmission end, refer to Chevrolet Type universal joint article following. Spicer used at front and rear of rear propeller shaft.

Crosley—Spicer #102 conventional universal joint used with Spicer #98-1182-X torque tube assembly. Universal is enclosed in ball housing secured to adapter at rear of transmission.

DESCRIPTION:—Needle bearing type. Design same as used on 1940 models except as follows:

Chevrolet Trucks—Hotchkiss drive now used.

Studebaker Models—One piece propeller shaft used. Slip joint formed by front yoke of front universal sliding on splines of transmission main shaft

DISCONNECTING UNIVERSAL:—Take out bolts in companion flange or remove nuts on U bolts mounting bearing cups on flange and remove U bolts. When disconnecting this type see that bearing cups do not fall off universal cross.

SERVICING:—Disassembly—Remove locking rings or take out capscrews and remove bearing cups. Tap or press on outer end of one bearing cup until cup on opposite side has been forced out of yoke end. Turn universal joint over and press first bearing cup out (applying pressure on exposed end of universal cross). Bearing cups are light press fit in yoke lugs.

Servicing—Wash all parts in gasoline. Clean out lubricant holes in cross. Examine all parts for wear.

Assembly—Place cross in yoke, install needle rollers in bearing cups, assemble retainer, new cork gasket, and dustcap, pack bearing cup and lubricant passage in cross with SAE. #160 oil, insert bearing cup in yoke end on cross. Use special clamp to press bearing cups in and compress sufficiently so that locking rings can be installed. See that locking rings are firmly seated in recess in yoke. On types using bearing caps, use new lock plate under screw heads, turn up lock tang against capscrew after screws have been securely tightened. On U bolt types, see that lockwashers installed under nuts.

NOTE—When shaft installed, arrows on shaft and yoke at slip joint must line up.

BUICK TYPE

Used On:

Series 40, 40A, 50, 60, 70, 90 (1941)

NOTE:—These models have Torque Tube drive and have a single universal within a ball housing at the rear of the transmission. Universal can be exposed by taking out ball housing flange bolts and sliding ball housing back on shaft.

DESCRIPTION:—Conventional cross type with hardened bushings on cross ends retained in holes in yokes by dowel pins or retainer rings.

Lubrication—Same as for 1940 models.

DISCONNECTING UNIVERSALS:—Rear yoke is integral with stub (splined) shaft and front yoke is bolted directly on rear end of transmission main shaft (speedometer drive gear is cut on yoke shoulder and speedometer drive must be disassembled before yoke is removed). Rear axle should be removed by taking out bolts in torque tube flange at rear end of ball housing and pulling shaft out of stub shaft. If universal is to be removed, special wrench can be inserted through opening in splined shaft and mounting screw removed from front yoke, or universal can be dismounted.

SERVICING:—Disassembly — Remove dowel pins or snap rings to free yoke bushings. Drive out bushings from inner side with flat nosed punch.

Buick Specifications—Clearance between cross journals and bushings should be .002-.004". Bushing clearance in yoke should be .004"-.006". Backlash or clearance of driveshaft splines in splineways in universal rear yoke should be .0005-.0045".

Assembly—Tap bushings in place with soft nosed hammer, being careful to keep bushings lined up so that bearing surface on cross journals is not marred. Install dowel pins or snap rings.

UNIVERSAL BALL HOUSING:—Cork oil seal used at rear end of outer retainer. Inner and outer retainers and universal ball are plated. To correct oil leaks past oil seal, disconnect rear axle, remove cork oil seal, adjust ball housing by removing shims from between inner and outer retainer until joint can be moved by hand at outer end (if bar must be used, housing is too tight), re-install cork seal.

NOTE—Cupped spring washer assembled between outer retainer and cork seal.

CHEVROLET TYPES

Used On:

Passenger Cars AG, AH & Comm'l (1941)
½ Ton Truck & Dubl-Duti AK, AJ (1941)
¾ Ton Truck AL (1941)—Front only

NOTE:—These models have Torque Tube Drive with a single Universal within a ball housing at the rear of the transmission. Universal can be exposed by taking out 4 retaining collar capscrews and sliding ball housing back on shaft.

¾ Ton Truck—This model equipped with Chevrolet type universal within a ball housing at the rear of the transmission but design of rear propeller shaft has been changed to incorporate Hotchkiss drive and Spicer universals are used on rear propeller shaft. Refer to Spicer Needle Bearing Type article above for data.

All Other Truck Models—Hotchkiss drive used on these models with Spicer universals. Refer to Spicer Needle Bearing type article above for data.

DESCRIPTION:—Roller bearing type (Pass. Cars and ½ Ton), hardened steel bushing type (¾ Ton —front). Universals have conventional cross with individual bearings on cross ends.

Hardened Steel Bushing Type—Bushings are installed individually in ends of yokes on cross and are retained in yokes by locking rings (yokes are open sided type and rings inserted through side opening to engage recess in bushing and yoke).

Needle Bearing Types—Two types of trunnion bearings used: 1) Wing type bolted to each yoke by two capscrews in each trunnion (used on front yoke of passenger cars only), 2) Round type fitted directly in yoke ends and retained by locking ring at inner end.

SERVICING:—Disassembly (Pass.Car&½ Ton). Remove 4 capscrews from universal joint ball collar, slide ball and collar back on shaft housing. Take out 4 capscrews in trunnion bearings on front yoke, remove trunnons (use care not to lose rollers—19 rollers used in each trunnion). Slide rear yoke off shaft and remove lock rings from bearings. Take off bearing caps by placing yoke in vise and driving down on center of cross with punch until cross seats on yoke, raise cross, insert 15/16" flat washer over bearing and continue to tap on cross until cap removed (do not lose rollers).

¾ Ton Truck—Same as for pass. cars (above) except that hardened steel bushings in front universal must be driven out after locking rings removed.

Servicing—Thoroughly clean all parts. Examine for wear and replace all worn or damaged parts.

Assembling—Reverse disassembling directions above. When installing needle bearing caps, Round type should be pressed on yoke just far enough to install snap ring, Wing type caps should be fitted to openings in front yoke. Universals and front propeller shaft (trucks) should be filled with transmission lubricant. NOTE—Pack needle bearings with grease before installing.

BUICK TYPE

Used On:

BUICK, SERIES 41-40, 40A, 50, 60, 70, 90 (1941)

TYPE:—Ball bearing, packless type. Same pump used on all series. Pump is same design as used on 1940 Buick models.

OVERHAUL:—Disassembly. Remove fan and fan pulley, use special puller to remove fan hub, take out rear cover screws and remove cover, remove bearing snap ring at forward end of pump body. Support pump in arbor press, press shaft out of impeller, lift impeller out, press shaft and bearing assembly out of pump body toward front.

Seal Assembly. Manufacturer recommends that seal not be disassembled (seal and impeller serviced as assembly). Carbon disc is ground convex on one surface and must be assembled with this face toward pump body.

Assembly. See that face of pump which contacts carbon seal is smooth (replace pump body if rough or burred). Use arbor press to install bearing and shaft assembly supporting pump body on press and applying pressure to bearing outer race only (do not press on shaft or bearing seal), install bearing snap ring. Press fan hub on shaft (support impeller end of shaft allowing pump to float on shaft so that bearings will not be damaged) until shaft projects beyond front face of hub exactly 13/64" (all models). Apply small amount of cup grease to impeller end of shaft, face of pump body and face of carbon disc, press impeller on shaft so that it is flush with end of shaft (support shaft as fan hub end allowing pump to float on shaft while installing impeller).

CADILLAC TYPE

Used On:

CADILLAC, SERIES 41-60S 61, 62, 63, 67, 75 (1941)

TYPE:—Self-adjusting type (spring-loaded packing rings require no adjustment in service) with shaft mounted on ball bearing (pulley end), bushing (impeller end). Same design as used on 1940 V8 models.

Lubrication. Grease fitting provided for rear bushing and packing assembly. Should be filled with water pump grease (G-13) every 1000 miles (front bearing requires no attention).

OVERHAUL:—Disassembly. Remove nut and lockwasher on front of pump pulley, remove pulley and woodruff key in shaft. Remove bearing snap ring in front end of housing, push impeller to rear to expose split washer in back of front bearing, remove washer. Remove snap ring at forward end of rear bushing assembly, withdraw impeller and shaft through rear end of housing. Remove rear bushing assembly toward front noting location of spring, spring seats, bushing and packing rings to insure correct reassembly. If necessary, press front bearing out of housing toward front, press bushing out of bearing.

Bushing & Packing Assembly. To assemble packings on shaft, install special pilot, No. J-831, on end of shaft, insert shaft in pump housing, wind washer groove on shaft with string to avoid damage to packing rings. Coat packing rings with water pump grease, install packing, spring, and bushing parts in same order as removed from pump (make certain that bushing installed with grooved side toward rear packing rings).

Pump Assembly. Reverse disassembling directions given above. Make certain that split washer and snap rings correctly installed and that fan pulley key is in place in shaft before tightening pulley nut.

CHEVROLET TYPE

Used On:

ALL PASSENGER CAR & TRUCK MODELS (1941)

TYPE:—Packless type with ball bearing shaft. Pump design changed over type used on 1940 cars and has two outlets so that water discharged along both sides of cylinders in block. Pump body is new design and is ¼" longer than 1940 type. Shaft bearing is permanently sealed and lubricated and cannot be removed from shaft (shaft and bearing are an assembly).

OVERHAUL:—Pump serviced only as a unit by the factory with no exchange.

Disassembly—Take out screws and remove rear cover plate. Use puller to remove fan pulley from shaft, remove bearing retainer cap. Support pump housing in arbor press, press bearing and shaft assembly out of impeller and housing toward forward end, lift off impeller and remove thrust washer and rubber seal from impeller recess. Do not attempt to remove bearing from shaft.

Seal Assembly—Install rubber seal in impeller hub (spring is integral part of seal), place thrust washer on seal with lugs on washer engaging slots in impeller so that washer bears against ground face of pump housing when impeller installed.

Assembly—Assemble pump in reverse order from disassembly. When installing pump on engine, make certain that correct fan installed for each model.

CHRYSLER TYPE

Used On:

CHRYSLER 6, MODEL C28 (1941)
DE SOTO, MODEL S8 (1941)
DODGE, MODEL D19 (1941)
PLYMOUTH, MODELS P11, P12 (1941)

TYPE:—Packless type with seal assembly located within impeller hub. Shaft mounted on two bushings in pump housing lubricated from single grease reservoir. Same design as used on corresponding 1940 models.

SERVICING:—Lubrication—Single grease fitting provided on lower left side of pump body. Keep reservoir filled with water pump grease (lubricate at 2000 mile intervals).

OVERHAUL:—Disassembly—Drive out fan pulley hub pin, pull hub using C-412 puller (discard old hub, always use new hub whenever hub removed from shaft). Take out screws and remove rear pump cover, withdraw impeller and shaft from rear end of pump body. Take out locking ring within impeller hub, withdraw seal parts. Drive out impeller pin and remove impeller from shaft (if impeller or shaft being replaced singly). To remove pump shaft bushings, drive front bushing pin through into bushing, use puller C-373 to pull both bushings out through front end of pump body.

Pump Bushings—Use Puller C-373 to install new bushings in pump body, make certain that thrust washer installed between bushings with large diameter hole toward rear of pump, install pin in hole in pump body and front bushing. Burnish bushings and reface pump housing with special tool C-384 (insert tool through rear end of pump, turn tool evenly in clockwise direction until cut has been taken on rear face of pump housing, withdraw tool while it is still being turned—this is important as tool will leave ridge on housing if turning stopped while tool is still in contact with pump housing

Seal Assembly—Install seal parts on shaft within impeller hub in following order: Thrust Spring (small end in toward impeller), Seal (use special tool C528 to install seal on shaft and make certain that metal spring cup in toward spring), Seal retainer thrust washer, and locking ring (ring must engage groove in impeller hub).

Assembly—Press impeller on shaft so that back of impeller is flush with end of shaft but do not install pin (assembly must be checked in housing first). Install seal parts in following order: Thrust Spring (small end in), Seal retainer (cupped end out) and seal using special tool C-528 to install seal on shaft, seal retainer washer (engaging ears in slots in impeller), and seal retainer lock ring. Slide impeller and shaft assembly into place in pump body, aligning the shaft and washer. Push shaft assembly into pump body firmly so as to compress seal and spring. Sight through water inlet and note clearance between face of seal retainer washer and lock ring in impeller hub. If clearance less than 3/32", remove assembly and press impeller further on shaft, recheck clearance. When correct clearance of not less than 3/32" secured, drill shaft and install impeller pin. Install impeller and shaft assembly mark location of old hub pin hole on front end of shaft. Press new fan hub on shaft (never use old hubs after they have once been removed from shaft) until clearance between front face of bushing and hub is .003", drill new hole through hub and shaft at right angles to old hole location, install new locking pin. Use new gaskets when installing pump cover and when installing pump on engine.

CHRYSLER BALL-BEARING TYPE

Used On:

CHRYSLER 8, MODELS C30, C33 (1941)

TYPE:—Packless type with ball bearing shaft. Seal is same type as used on other Chrysler models (above). Pump is same design as used on corresponding 1940 car models except for addition of lubrication fitting for pump seal (see Servicing).

SERVICING:—Lubrication—Single fitting on pump body for seal lubrication (shaft bearing is sealed type and does not require lubrication in service). Lubricate pump with Water Pump Grease at 2000 mile intervals.

OVERHAUL:—Disassembly—Use special puller C-498 to remove impeller from shaft (back cover normally left on engine when pump removed). Remove lock ring in impeller hub and withdraw seal parts. Drive out pin in fan pulley hub and remove hub with Puller C-412 (discard both impeller and hub when removed from shaft, old parts cannot be re-installed). Remove bearing lock ring from groove in pump body hub, pull shaft and bearing assembly out of housing (do not attempt to remove bearing from shaft, no inner race used and these parts furnished as an assembly).

Seal Assembly—See directions above for other Chrysler models. Always use new impeller whenever impeller removed from shaft (old impeller will not fit tightly on shaft if re-installed).

Pump Assembly—Install shaft and bearing assembly in pump body (press on outer bearing race only) so that groove in bearing is in line with groove in body and install bearing locking ring. Use special tool C-551 to reface thrust washer bearing face on pump body piloting tool on pump shaft and using **flat (90°) end of tool only** to form perfectly flat surface in pump body for thrust washer bearing. Press the new impeller and seal assembly on shaft so that endplay is .0025-.0045" (measure between fan pulley hub and front face of pump body). If fan pulley hub has been removed, press new hub on shaft, drill hub and shaft and install locking pin.

FORD-MERCURY TYPE

FORD NO. 9N-8501—SEE NOTE

FORD 4 CYL. COMM'L. & TRUCK MODELS (1941)

NO. 78-8501 (RH), 78-8502 (LH)

FORD '85', ALL MODELS (1941)—SEE NOTE
MERCURY, MODEL 19A (1941)

NO. 79-8501 (RH), 79-8502 (LH)

FORD '95', TRUCK MODELS (1941)

FORD '85' TRUCK MODEL NOTE:—This 78-8501 & 2 type pump used on all truck models with '85' engine except Cab-over-Engine models. All Cab-over-Engine models equipped with 79-8501 & 2 pumps (same as used on '95' truck models).

TYPE:—Packless type with shaft mounted on bronze bushing ('78' types), sealed ball bearings packed with grease ('79' types). Pumps are same design as used on corresponding 1940 models (except 4 Cyl. Pump which is new design).

4 Cyl. Pump—Pump is ball bearing type (similar to '79' type) and is mounted on front end of engine block with a back cover plate mounted on the pump body by capscrews. Fan is bolted on shaft in front of water pump pulley. This pump serviced in same manner as '79' type except that screws must be taken out and cover removed for access to impeller.

OVERHAUL:—Disassembly. Place pump in arbor press, press impeller and shaft assembly out of pulley (see note below for '79' types), lift off pulley and front thrust washer, remove impeller and shaft through rear of housing. Press old bushing out of housing. To dismantle seal, remove snap ring within impeller hub at forward end, remove seal parts (note order and assemble in same positions).
NOTE FOR '79' PUMPS. Shaft and bearing assembly must be pressed out of housing toward forward end (bearing seats against shoulder in housing at rear). Do not dismantle this assembly (replace as a unit).

Seal Assembly. When installing seals, install parts in following order: Spring (large end in toward impeller), Spring Guide (tangs out), Seal Clamp Ring, Seal (with projecting face in, and lugs engaging slots in impeller hub), Thrust Washer (engage lugs in impeller hub slots), Snap Ring.

Pump Assembly—Use special tool V-247 to reface front and rear thrust faces of pump housing (necessary to prevent excessive thrust washer wear). Assemble pump by reversing disassembly instructions.

GRAHAM TYPE

Used On:

GRAHAM, HOLLYWOOD MODEL 113 (1941)
GRAHAM, SUPERCHARGED HOLLYWOOD MODEL 109 (1941)

TYPE:—Packless type with ball bearing shaft. Same design as used on previous Graham models.

OVERHAUL:—Disassembly. Take out capscrews and remove rear cover plate, remove bearing locking wire from housing (end of locking wire visible in slot in housing hub at center of bearing assembly). Support pump housing in arbor press, press shaft out of impeller and shaft and bearing assembly out of housing toward front end.

Seal Assembly. Install seal in same order as when taken out (carbon disc next to housing, rubber seal with larger diameter against carbon disc, spring retainer with dished side toward rubber seal, spacer, and spring with large end toward rubber seal).

Pump Assembly. Reverse disassembly directions given above. Make certain that locking wire is installed to retain bearing and shaft assembly.

HUDSON TYPE

Used On:

HUDSON 6, MODELS 10, 11, 12, 18 (1941)
HUDSON 8, MODELS 14, 15, 17 (1941)

TYPE:—Packless type. Shaft mounted on two bushings in housing with single lubricant fitting (both bushings lubricated from central reservoir). Same design as used on corresponding 1940 models.
NOTE—Pump used on Models 15, 17 has second outlet for by-pass. This by-pass not used on other models.

OVERHAUL:—Pump shaft is peened over at each end to retain impeller and fan hub. Manufacturer recommends use of special Tool Set J-733B consisting of special body to be bolted to pump in place of impeller housing, pullers and pushers (for bushing service), and cutter (to remove burr on shaft so that shaft can be pressed out).

Disassembly:—Remove fan and pulley, take out screws and remove impeller housing. Clamp pump upright in vise (grip fan hub in vise jaws), mount tool set body on pump, assemble cutter and thumbscrew and cut burr off shaft at impeller end (turn cutter with wrench while applying pressure with thumbscrew). Install driver and press shaft through impeller, remove shaft from forward end. Lift off impeller and baffle plate, pull old bushings (rear bushing toward rear, front bushing toward front). To dismantle seal, take out locking ring in impeller hub, lift out seal parts.

Bushing Installation—New bushings have inside diameter of .6205-.6206" which is reduced to .6185-.6190" when bushing pressed in place. Bushings cannot be reamed and special bushing pilot must be used to press bushings in (driving bushings with hammer causes bushings to collapse). Shaft clearance will be .0015-.0025" if bushings properly installed.
NOTE—Thrust face of rear bushing must be burnished smooth and flat to prevent thrust washer wear. Use burnishing tool J-733A-5 (spin burnishing tool with socket wrench with thumbscrew 'finger tight' to supply pressure, release pressure while turning tool—this is important). Bushing face must be highly polished and free from all burrs or scratches.

Assembly—Press new bushings into place. Assemble seal in following order: compression spring, seal retainer, seal, thrust washer, locking ring (see that it engages groove in impeller hub). Install shaft assembly, place baffle and new impeller assembly on shaft, peen impeller end of shaft (use ball peen hammer) until endplay as measured between pulley flange and front bushing face is .010-.014". Assemble impeller housing on pump body, fill grease reservoir with aluminum soap base lubricant before installing pump on engine.

SERVICING:—Lubrication—Water pump grease fitting is special type with spring-loaded plunger which cuts off grease inlet when reservoir filled to prevent overfilling and excessive pressure which would force grease past bushings. Lubricate at 1000 mile intervals. Use only an aluminum soap base grease.

LINCOLN TYPE

NO. 06H-8501 (RH), 06H-8502 (LH)
LINCOLN, ZEPHYR & CONTINENTAL 16H (1941)
LINCOLN, CUSTOM MODEL 168H (1941)

TYPE:—Packless type. Shaft mounted on ball bearing (front) bronze bushing (rear) with oiler for rear bearing only (front ball bearing packed with grease and requires no attention). Pumps are same design as used on 1940 later cars and similar to types used on previous models except for longer shaft and other new parts.

SERVICING:—Lubrication—Oiler provided for rear bushing. Lubricate with engine oil at 1000 mile intervals. Front ball bearing requires no attention.

OVERHAUL:—Disassembly—Drive out pin in pulley hub, remove pulley from shaft. Remove bearing lock ring from groove in forward end of pump body hub. Drive out pin in impeller hub, remove impeller and seal assembly from shaft. Press shaft and bearing assembly out of pump body toward front end. To dismantle shaft and bearing assembly, remove locking ring in groove in shaft directly behind bearing, take off bearing felt packing retainer and packing, press bearing off shaft.

Seal Assembly—Seal is assembled in cage which fits on shaft in front of impeller. To assemble seal, install parts in cage in following order: Packing Spring (large end seated in cage), Packing Retainer Washer or cup (cupped end out to receive packing), Seal Packing (fits in cupped end of retainer), Disc or thrust washer. NOTE—Ears on thrust washer disc must engage slots in cage (disc is 4 pronged type).

Pump Assembly—To install new bushing in pump body, press old bushing out, press new bushing in so that rear end is flush with thrust washer face in pump body, ream bushing with special reamer Z-193 and reface rear end of bushing and pump body with special tool Z-191. Install front felt retainer, felt packing, inner spacer, and lock ring on shaft behind front ball bearing, press shaft and bearing assembly in pump body, install outer spacer on shaft in front of bearing and lock ring in pump body groove. Install seal assembly and impeller on rear end of shaft, pin impeller to shaft.

NASH TYPE

Used On:

NASH '600', MODEL 4140 (1941)
NASH AMBASSADOR SIX, 4160 (1941)
NASH AMBASSADOR EIGHT, 4180 (1941)

TYPE:—Adjustable packing type with floating impeller (impeller installed in slotted end of shaft and held in place by tubular brass rivet). Shaft mounted on hard bronze bushing with grease fitting for lubrication. Pumps are same design as used on 1940 models.

SERVICING:—Lubrication—Lubricate with water pump grease at 2000 mile intervals. Use care not to overlubricate which would force grease out into cooling system.

Packing Adjustment—Adjust only with engine idling. Turn packing nut up just enough to stop water leaks.

OVERHAUL:—Take out screws in cover plate, remove cover. Remove rivet in impeller hub, remove impeller, withdraw shaft. When reassembling pump, install impeller and insert tubular brass rivet, support shaft through outlet hole, work through hole in body and rivet impeller on shaft.

OLDSMOBILE TYPE

Used On:

SIX, '66' F-41, '76' G-41, '96' H-41 (1941)
EIGHT, '68' E-41, '78' J-41, '98' L-41 (1941)

TYPE:—Packless type with ball bearing shaft. Same design as used on 1940 car models with special brass moisture slinger on shaft as follows:

Brass Moisture Slinger—Consists of small cup shaped brass slinger installed on shaft at rear of ball bearing. This slinger, No. 413778, serviced separately and new slinger should be installed whenever pump is serviced. See directions below.

OVERHAUL:—Disassembly—Remove cover plate on back of pump housing, remove pulley from pump shaft flange. Take out bearing lock ring in slot in top center of bearing hub on housing. Support outer end of pump body in arbor press, press shaft and bearing assembly out of impeller and housing toward front end. Bearing cannot be disassembled and must be replaced with the shaft as a unit. To remove seal assembly, take out snap ring in seal recess in rear end of housing, withdraw seal parts.

Pump Shaft Moisture Slinger—To install slinger, start slinger on shaft with flared end toward bearing, stand shaft and bearing assembly in arbor press with slinger end up, use special tool J-1446 to press slinger down on shaft until slight drag is felt on .025" feeler placed between end of bearing and slinger. CAUTION—This .025" clearance between slinger and bearing is necessary to secure proper protection for bearing without slinger dragging on bearing which will cause noise.

Seal Assembly—Machined seat in pump housing must be smooth and clean to insure good seating of seal. Make certain that seat not scored, clean with thinner to remove all dirt and gum, wipe dry or use Pump Body Cleaning Reamer, No. J-1455, to clean pump body before installing seal. Install seal using tool No. J-1456 and see that seal does not hang up on sides of casting (wetting housing with soap solution will facilitate seal installation), install seal snap ring.

Assembly—Support pump body in arbor press, press shaft and bearing assembly in until bearing lock ring lines up, install lock ring. Press impeller on shaft until clearance between rear finished face of impeller and rear face of pump body is 1/32". Install rear cover plate (use new gasket) and pulley.

Pump Installation (8 Cylinder Models)—Use new neoprene grommet in by-pass hole in cylinder head when installing pump. This type by-pass not used on 6 Cylinder models.

PACKARD TYPE

Used On:

CLIPPER MODEL 1951 (1941)
'110' SIX 1900, '120' EIGHT 1901, 1A (1941)
'160' SUPER EIGHT 1903, 3A, 4, 5 (1941)
'180' CUSTOM SUPER EIGHT, 1906, 7, 8 (1941)

TYPE:—Packless type with ball bearing shaft. Same design as used on corresponding 1940 models.

OVERHAUL:—Note—Rebuilt pumps available from factory on 'exchange' basis. To service pumps proceed as follows:

Disassembly—Remove fan and pulley, take out bearing locking ring in slot in bearing hub on housing. Support pump housing in arbor press, press impeller off shaft, remove shaft and bearing assembly through front of housing. To remove seal, take out locking ring in impeller hub, withdraw composition thrust washer, rubber seal, spring cup and spring. NOTE—Do not remove fan pulley hub or attempt to remove bearing from shaft. Shaft, bearing, and pulley hub serviced as an assembly.

Seal Assembly—When installing seal in impeller, make certain that small end of spring in toward impeller, coat inner surface of seal with glycerine and install with larger flanged face out toward composition washer, install composition thrust washer with smooth (convex) face out toward pump housing, install locking ring.

Assembly—Install shaft and bearing assembly in pump housing making certain that locking ring groove in bearing lines up with slot in pump housing. Coat impeller end of shaft with glycerine (to prevent damage to seal when impeller pressed on). Heat impeller in water just under boiling point for 1½ minutes, press impeller on shaft until clearance between impeller vanes and housing is .012-.074". Coat pump cover gaskets with Perfect Seal Grade A gasket paste when installing cover. Make certain that bearing locking ring installed in pump housing slot.

PONTIAC TYPE

Used On:

SIX, MODELS 41-24, 25, 26 (1941)
EIGHT, MODELS 41-27, 28, 29 (1941)

IMPORTANT SERVICE NOTE:—1939-40-41 Pumps—Impeller clearance (distance from rear face of impeller to rear face of pump body) should be 3/64" and not 9/64" as previously specified for these models. See Overhaul data below.

TYPE:—Packless type with ball bearing shaft. Same design as pump used on 1940 car models.

Pump Bearing Shield—Consists of a neoprene shield installed in the pump housing between the bearing and the water pump seal. Shield prevents moisture collecting on bearing.

OVERHAUL:—Disassembly. Remove fan and pulley, and cover plate on rear of pump housing. Take out shaft retainer wire (bearing lock ring) in slot at top center of bearing hub on housing. Support front face of pump housing in arbor press, press shaft and bearing assembly out of impeller and housing toward front end. Remove seal assembly from housing. If shaft and bearing assembly being replaced, press fan hub off old shaft and install on new shaft.

Servicing—If bearing retainer wire worn (indicating that bearing rotates and has excessive end thrust), or if impeller scrapes on housing due to excessive end thrust, pump assembly should be replaced. If bearing is rough or bearing seals loose in outer race so that they can be turned by hand, replace bearing and shaft assembly. Carbon washer, rubber seal, and spring are furnished as a package unit.

Assembly—Install seal assembly in pump housing in following order: inner spring cup (cupped side out), spring, outer spring cup (flange out toward seal), rubber seal (smaller diameter out, make certain that flared portion of inner spring cup enters rubber seal so that it is retained in housing when installed), carbon washer with polished side toward impeller (see that ears on washer engage slots in housing). Install neoprene shield in bearing bore in housing with smaller diameter end toward seal and larger diameter end toward bearing. Insert bearing and shaft assembly in from front, lining up retainer groove with slot in housing (if bearing is press fit in housing, remove fan hub install bearing in arbor press applying pressure on outer race only, re-install fan hub applying pressure to impeller end of shaft and allowing housing to float on bearing so that no pressure exerted on bearing or races). Press impeller on shaft (support assembly on fan end of shaft) until clearance between rear face of impeller and face of cover plate flange on housing is 3/64". Install shaft retainer wire through slot in housing, use new gasket and install pump rear cover plate.

STUDEBAKER CHAMP. & PRESIDENT TYPE

Used On:

CHAMPION, MODEL 3G (1941)
PRESIDENT, MODEL 7C (1941)

TYPE:—Packless type with ball bearing shaft. Same design as used on 1940 Champion model except for new seal assembly as follows:

Seal Assembly—Consists of separate spring and spring cups, rubber seal, seal washer, and seal lock ring. Assembly is retained in impeller hub by lock ring which engages notch in forward end of hub.

OVERHAUL:—Disassembly—Remove bearing lock ring from slot in housing hub at center of bearing. Support housing in arbor press and press shaft and bearing out of impeller and housing toward front. Support fan hub in press and press shaft out of hub (if fan hub removed, always use new hub when reassembling pump). To disassemble seal, remove lock ring from forward end of seal recess in impeller hub, withdraw seal washer, seal, seal spring and cups.

Seal Assembly—Install seal parts in same order as removed, make certain that lock ring engages notch in impeller hub to retain seal assembly.

Pump Assembly—Examine thrust face in pump housing which bears against seal washer. Reface this surface with Water Pump Facing Tool No. J-1501 if surface is rough or scored. If fan hub removed, press new fan hub on shaft so that it is flush with end of shaft, install shaft, bearing, and fan hub in housing so that retainer lock ring groove on bearing lines up with slot in housing, install lock ring. Press impeller on shaft so that clearance between impeller and housing is 1/32". On President pump, install rear cover (no cover used on Champion). CAUTION—Always use new fan hub when hub removed from shaft (old hub will not be tight fit on shaft if re-installed).

STUDEBAKER COMMANDER TYPE

Used On:

COMMANDER, MODEL 11A (1941)

TYPE:—Adjustable packing type. Shaft supported on two bushings with pressure gun fitting (front bushing), grease cup (rear bushing). Same design as used on 1940 Commander model.

SERVICING:—Packing Adjustment—Adjust packing by turning up adjusting nut (insert screwdriver between pulley and pump housing). Packing is grapho-metal ring type and requires more pressure than ordinary packing. To renew packing, thoroughly clean out old packing, install four new packing rings, one at a time, tightening adjusting nut down on each ring as it is installed. This special ring packing prevents shaft scoring (with more than ordinary adjusting nut pressure) and gives longer service.

Lubrication—Use chassis lubricant in pressure gun fitting on front bushing, water pump grease (Kasson or other water proof grease) in grease cup at rear bushing.

OVERHAUL:—Disassembly—Remove rear cover plate and fan pulley. Press fan hub off forward end of shaft, withdraw shaft and impeller assembly through rear of pump. Remove packing nut and packing. Press front bushing out toward front, rear bushing out toward rear.

Assembly—Install new bushings. Insert impeller and shaft assembly into housing from rear, press new fan hub on shaft until clearance between hub and pump housing is .003-.005". See Servicing data above for Packing installation and adjustment.

CAUTION—Always use new fan hub when hub removed from shaft (old hub will not be tight fit if re-installed).

WILLYS TYPE

Used On:

AMERICAR & PLAINSMAN MODEL 441 (1941)
WILLYS PICK UP 441, PANEL DELIVERY 441P ('41)

TYPE:—Packless type with ball bearing shaft. Same design as used on 1940 Willys models.

OVERHAUL:—Disassembly—Use special W-116 puller and pull impeller off shaft, lift out bakelite seal washer. Remove bearing lock ring from slot in bearing hub on pump housing, support pump housing in arbor press, press shaft and bearing assembly out of pump housing toward forward end. To remove fan pulley from shaft, use any regular puller (special W-115 puller furnished for this purpose) to pull pulley off shaft. Do not attempt to remove bearing from shaft (shaft and bearing serviced as assembly).

Servicing—If rear face of pump housing (on which bakelite seal washer bears) is not smooth and flat, reface with special tool W-114.

Seal Assembly—Rubber seal is of 'U' section with spring in recess in seal,. Install seal in recess in impeller hub, place bakelite thrust washer on seal, engaging ears on washer in slots in impeller hub.

Assembly—Reverse disassembly directions above. Make certain that bearing lock ring installed in slot in pump housing bearing hub so as to engage groove in bearing shell.
